# 2005 CORN CROP REVIEW

## Statewide Growing Conditions

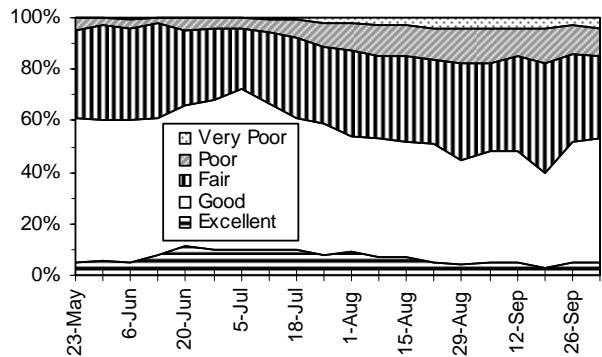

The 2005 growing season generally fit the long-term pattern of adequate early-season precipitation, followed by hot, dry conditions in late July and August. Topsoil moisture was at least adequate in most of the state in late March and April (Figure 1). May was relatively dry, with close to half the crop acreage classified as having short to very short topsoil moisture early in the month. Substantial rains in early June replenished the upper soil profile so that more than 90% of the cropland had adequate or surplus topsoil moisture in mid-June. Topsoil moisture declined from late June until early August, with more than half the acreage classified as short to very short from mid-July to mid-August. Late-August rains helped later-maturing fields, but provided little benefit to the portion of the crop that had already matured.

**Figure 1. Statewide status of topsoil moisture.**

The condition of the corn crop was closely tied to the pattern of precipitation. June precipitation enabled the proportion of the corn crop classified as good or excellent to reach a peak of more than 70% in early July (Figure 2). Condition of the crop generally declined from that point until the beginning of harvest, when just less than 50% was classified as good or excellent. The steepest decline in late July and early August coincided with the extended period of hot, dry conditions.

(Crop-Weather Reports, Kansas Agricultural Statistics, Topeka)

**Figure 2. Condition of 2005 Kansas corn crop.**

## Diseases

From a plant-disease perspective, the 2005 growing season was an average year in Kansas. Approximately 40 corn samples were received in the Kansas State University Plant Disease Diagnostic Laboratory. Of these, 57% were identified as being caused by environmental, fertility, or chemical problems. Some of the more common of these problems included various injuries from herbicides, cold-weather crown stress, physiological leaf spot, and potash deficiency.

Of those samples with true disease problems, stalk rots and ear rots were the most common. Severity of these problems was close to long-term averages. Identified stalk rots included *Fusarium*, *Gibberella*, and charcoal rot. Identified ear molds included *Fusarium*, *Penicillium*, and *Diplodia*. As in 2004, aflatoxin was not a significant problem anywhere in the state.

Two diseases of note that were reported from Northwest Kansas in 2005 were Goss's bacterial wilt and corn lethal necrosis. Although common in the 1980s, these diseases have not been seen in Kansas for a number of years. It will be interesting to see if these were isolated incidences, or if they are beginning to make a comeback similar to what has been seen with head smut in recent years.

(Doug Jardine, Kansas State University Department of Plant Pathology)

## Insects

Overall, it was a relatively quiet year for corn insect pests. A few fields had early-season wireworm damage in Northeast Kansas. Several fields of corn planted into wheat, which had been used for winter grazing and then killed, had infestations of wheat stem maggots. These small fly larvae feed on the growing point of corn seedlings and actually reduced stands, causing some replanting. Although not common, this situation has been reported before. Rootworm infestations were probably about average or a little less than average. Southwestern corn borer damage was reported from several locations in north-central Kansas.

Damaging southwestern corn borer infestations traditionally have been confined to southwest Kansas, but yield losses occasionally have been reported from central Kansas. Other insect or mite pests (European corn borers, spider mites, etc.) did not seem to be as problematic as in past years.

(Jeff Whitworth, Kansas State University Department of Entomology)

## Harvest Statistics

The October 12 Crops Report predicted a 429-million-bushel crop, down 1% from last year (Figure 3). In 2005, 3.30 million acres were harvested, up 15% from 2004. The predicted average yield of 130 bushels per acre is 20 bushels less than the 2004 average. (Kansas Agricultural Statistics)

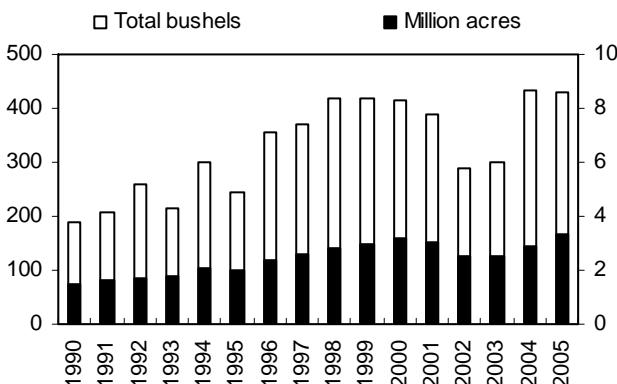

Figure 3. Historical Kansas corn production.

## 2005 PERFORMANCE TESTS

### Objectives and Procedures

Corn Performance Tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and seed industry personnel with unbiased agronomic information on many of the corn hybrids marketed in the state. Entry fees from private seed companies help finance the tests. Seed companies receive test announcements and entry forms in late January each year; deadlines for receipt of completed entry forms and seed are in early March. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown uniformly at all test locations.

Short-season corn performance tests target hybrids for early-planted, short-season cropping systems. These systems typically are used on soils with poor water-holding capacities, often subjecting the hybrids to severe heat and drought stress in July and August. Early-maturing hybrids can escape a good portion of the typical stress if they are planted early.

A summary of growing-season weather data is given in individual test discussions. These data are from the nearest weather-reporting station and often are supplemented with information from the test site. Precipitation graphs include cumulative lines for 2005 and the 30-year normal, in addition to the daily rainfall amounts since last fall. Temperature graphs include daily maximum and minimum temperatures compared with normal. General trends in precipitation and temperature relative to normal are readily observed in the graphs. A table with monthly totals and averages for the growing season also is included.

The growth unit or growing-degree-day concept was developed to measure the amount of heat available for growth and maturation. To calculate the daily accumulation, add the maximum and minimum temperatures for each day, divide by 2, and subtract a base temperature of 50. Any temperature below 50°F was considered to be 50, and any temperature over 86°F was considered 86.

Explanatory information is given preceding data summaries for each test. Tables 2 through 26 contain results from the individual performance tests. Hybrids are listed in order of increasing days to half silk and increasing grain moisture for the current year, so hybrids of similar maturity are shown together. Many companies submitted seed treated with systemic insecticides (Cruiser, Poncho) that can affect yield in some situations. A column listing insecticide seed treatments for each hybrid is included to help interpret yield results.

Figures 4 through 9 graphically summarize yield and maturity information over the past few years for each region. In these figures, hybrid performance is standardized by using the average of two check hybrids present in every test. The number beside each bar shows the number of tests in which a given hybrid was compared with the check hybrids. In general, the greater the number of comparisons, the greater confidence one can place in the stated performance of that hybrid. Symbols beside each bar indicate if a hybrid was significantly greater (+) or lower (-) than the average of the check hybrids. As with individual test results, small differences should not be overemphasized. Relative ranking and large differences are better indicators of performance.

Most corn tests were planted at a rate 10% to 20% in excess of the desired population and thinned only to remove doubles. Planting to stand enables evaluation of product performance for the entire growing season.

Four plots (replications) of each hybrid were grown at each location in a randomized complete-block design. Each harvested plot consisted of two rows trimmed to a specific length, ranging from 20 to 30 feet at the different locations. Four-row plots were used at some locations where drought stress is common. Tests were harvested with specialized plot combines equipped with automatic weighing and sampling devices.

Grain yields are reported as bushels per acre of shelled grain (56 lbs/bu) adjusted to a moisture content of 15.5%. Yields also are presented as percentage of test average to speed recognition of highest-yielding hybrids. Hybrids yielding more than 100% of the test average year after year merit consideration. Adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

The percentage of lodged stalks is reported when appropriate. Plants broken over below the ear and dropped ears were considered lodged, although most were

harvestable with modern machinery. Severely lodged stalks or dropped ears that could not be picked up by normal harvest procedures were not included in yield. Because harvest often is delayed until latest-maturing entries are ripe, early and mid-season hybrids could lose ears simply because they must wait well past their optimum harvest date. In most years at most locations, dropped ears constitute a very small portion of lodging and do not significantly affect yields.

Relative maturity is measured in terms of both number of days from planting to silking and grain moisture at harvest. Entries are listed in order of increasing maturity based on days to silking and harvest moisture in the current year to facilitate comparison of hybrids of like maturity. Maturity can be critical when considering a corn hybrid for a specific cropping system.

Small differences in yield or other characteristics should not be overemphasized. Least significant differences (LSDs) are shown at the bottom of each table. Unless two entries differ by at least the LSD shown, little confidence can be placed in one being superior to the other. Yield values in the top LSD group in each test are highlighted in bold. The coefficient of variability (CV) can be used in combination with the LSD to estimate the degree of confidence one can have in published data from replicated tests.

## NORTHEAST KANSAS DRYLAND CORN TEST ON SILT LOAM SOIL

Private farm 1 mile north of Severance; Fuhrman Farms, Inc.

Monona silt loam; Soybean in 2004

180 - 30 - 0 lb/a N, P, K

Planted on 4/19/2005; Harvested on 9/19/2005

Target stand of 26,000 plants/acre; 8.0 in. spacing

Freezes on April 31 and May 2 burned off the top 2" of growth. Plants initially came back slowly with dry weather. Favorable rainfall during the rest of the season resulted in good yields.

\* C=Cruiser®, P=Poncho®, LHB=Latitude® hopper box treatment containing Gaucho®. Numbers indicate rates if available.

\*\* Unless two varieties differ by more than the LSD, little confidence can be placed in one being superior to the other.

Yields in bold are in the top LSD group.

## NORTHEAST KANSAS DRYLAND CORN TEST ON SILTY CLAY LOAM SOIL

Private farm north of Centralia; Keith Flentie, farmer/cooperator

Wymore silt loam; Soybean in 2004

130 - 30 - 0 lb/a N, P, K

Planted on 4/19/2005; Harvested on 9/19/2005

Target stand of 23,000 plants/acre; 9.1 in. spacing

Freezes on April 31 and May 2 burned off leaves but caused little stand loss. Plants initially came back slowly with dry weather, but heavy rains in June stimulated excellent vegetative growth. Cultivation on June 8 controlled most escapes from pre-emergence herbicide application.

## NORTH-CENTRAL KANSAS DRYLAND CORN TEST

North Central Kansas Experiment Field, Belleville; Barney Gordon, agronomist; Michael Larson and Allan Milner, technicians

Crete silt loam; Soybean in 2004

180 - 30 - 0 lb/a N, P, K

Planted on 4/28/2005; Harvested on 10/6/2005

Target stand of 22,000 plants/acre; 9.5 in. spacing

Planting was delayed by wet conditions. Good stands and early growth. Dry conditions during pollination in late June and early July caused sufficient stress to reduce yields.

## NORTHEAST KANSAS DRYLAND CORN TEST ON SILT LOAM SOIL

Agronomy North Farm near Manhattan; Kraig Roozeboom, agronomist

Reading silt loam; Soybean in 2004

130 - 30 - 0 lb/a N, P, K

Planted on 4/16/2005; Harvested on 9/14/2005

Target stand of 23,000 plants/acre; 9.1 in. spacing

Freezes on April 31 and May 2 burned off the top 2" of leaves. Plants recovered slowly under dry conditions. Good rainfall in June caused excellent vegetative growth, but dry conditions in late July and August resulted in small kernels. Weed control was excellent. Little disease or insect damage.

## NORTHEAST KANSAS SPRINKLER-IRRIGATED CORN TEST ON SILT LOAM SOIL

Kansas River Valley Experiment Field, Topeka; Larry Maddux, agronomist; Charles Clark and William Riley, technicians

Eudora silt loam; Soybean in 2004

160 - 35 - 0 lb/a N, P, K

Planted on 4/19/2005; Harvested on 9/20/2005

Target stand of 26,000 plants/acre; 8.0 in. spacing

Several heavy rains in late May and early June seem to have leached fertilizer N from the soil profile, especially in areas with a coarser subsoil. This loss of N probably reduced yields from what they would have been with adequate N.

## NORTHEAST KANSAS SPRINKLER-IRRIGATED CORN TEST ON SANDY LOAM SOIL

Private farm near Clay Center; Mark Taddiken, cooperator

Muir silt loam; Soybean in 2004

200 - 15 - 0 lb/a N, P, K

Planted on 4/20/2005; Harvested on 10/4/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Excellent early-season growth. No evident disease or insect problems. Lodging was extensive for some hybrids, likely due to Fusarium stalk rot. Irrigation pump problems from June 26 to July 8 may have introduced some stress during the critical period of stalk elongation, which predisposed the plants for Fusarium infection.

## NORTH-CENTRAL KANSAS SPRINKLER-IRRIGATED CORN TEST

Irrigation Experiment Field, Scandia; Barney Gordon, agronomist; Michael Larson and Allan Milner, technicians

Crete silt loam; Soybean in 2004

220 - 30 - 0 lb/a N, P, K

Planted on 5/2/2005; Harvested on 10/25/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Spring rains delayed planting, but stands were excellent. Spring temperatures alternated between above-average and below-average periods. Ideal growing and grain filling conditions except for a dry period in late June and early July.

Values within bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

## EASTERN KANSAS DRYLAND CORN TEST ON SILTY CLAY LOAM

Private farm northwest of Topeka; Larry Maddux, agronomist; Charles Clark and William Riley, technicians

Silty clay loam; Soybean in 2004

155 - 35 - 0 lb/a N, P, K

Planted on 4/15/2005; Harvested on 9/16/2005

Target stand of 22,000 plants/acre; 9.5 in. spacing

Generally favorable rainfall amount and distribution resulted in yields that were better than expected.

The finer soil texture at this site likely retained water and soil N better than at the irrigated test site near Topeka.

## EAST-CENTRAL KANSAS DRYLAND CORN TEST ON UPLAND SILT LOAM SOIL

East Central Kansas Experiment Field, Ottawa; Larry Maddux, agronomist; Jim Kimball, technician

Woodson silt loam; Soybean in 2004

120 - 30 - 15 lb/a N, P, K

Planted on 4/15/2005; Harvested on 9/20/2005

Target stand of 21,000 plants/acre; 10.0 in. spacing

Strip tillage in early March supplied a good seedbed. Sulfer at 5 lb/a and most of the N, P, and K were applied in bands under each row during the strip tillage. Additional N and P were applied in bands at planting. Rainfall was generally favorable.

## SOUTHEAST KANSAS DRYLAND CORN TEST ON UPLAND SOIL

Four-State Farm Show, Pittsburg; James Long, agronomist; Kelly Kusel, research technician

Parsons silt loam; Soybean in 2004

140 - 75 - 60 lb/a N, P, K

Planted on 4/4/2005; Harvested on 8/26/2005

Target stand of 22,000 plants/acre; 9.5 in. spacing

Excellent conditions throughout the season. Two exceptions were a late frost that burned back leaves, but caused little loss of stand, and a European corn borer infestation.

## SOUTH-CENTRAL KANSAS NO-TILL DRYLAND CORN TEST ON SILT LOAM SOIL

Harvey County Experiment Field, Hesston; Mark Claassen, agronomist; Lowell Stucky and Kevin Duerksen, technicians

Smolan silt loam; Wheat in 2004

125 - 37 - 0 lb/a N, P, K

Planted on 4/18/2005; Harvested on 9/9/2005

Target stand of 18,000 plants/acre; 11.6 in. spacing

Rodents caused some stand variability. Early May freeze burned back leaves, but did not kill seedlings. May and early June had above-normal precipitation, July was slightly below normal, and August was above normal. Limited drought stress occurred in late July and early August. Temperatures were normal or below all season except for June, which was slightly above normal. No insect or disease damage was observed.

## SOUTH-CENTRAL KANSAS IRRIGATED CORN TEST ON SILT LOAM SOIL

Private farm near Inman; Kraig Roozeboom, agronomist; Norman and Tracy Schmidt, cooperators

Crete silt loam; Soybean in 2004

165 - 30 - 0 lb/a N, P, K

Planted on 4/21/2005; Harvested on 9/29/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Planted into slightly wet soil but resulting stands did not seem to suffer. Weed control was not as effective as usual due to initially dry conditions after planting and very wet conditions in early June. Diseases and insects caused no noticeable problems.

## SOUTH-CENTRAL KANSAS IRRIGATED CORN TEST ON SANDY LOAM SOIL

Private farm near St. John, Russell & Son Farms; Kraig Roozeboom, agronomist; Rick Russell, cooperator

Carwile fine sandy loam; Corn in 2004

225 - 36 - 0 lb/a N, P, K

Planted on 4/21/2005; Harvested on 9/15/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Generally favorable conditions and insecticide control of corn root worms resulted in no lodging and excellent yields. Rainfall from May 2 through August 11 was 21.68", well above normal.

## WEST KANSAS NO-TILL DRYLAND CORN TEST

Agricultural Research Center - Hays; Ken Kofoid, agronomist

Harney clay loam; Soybean in 2004

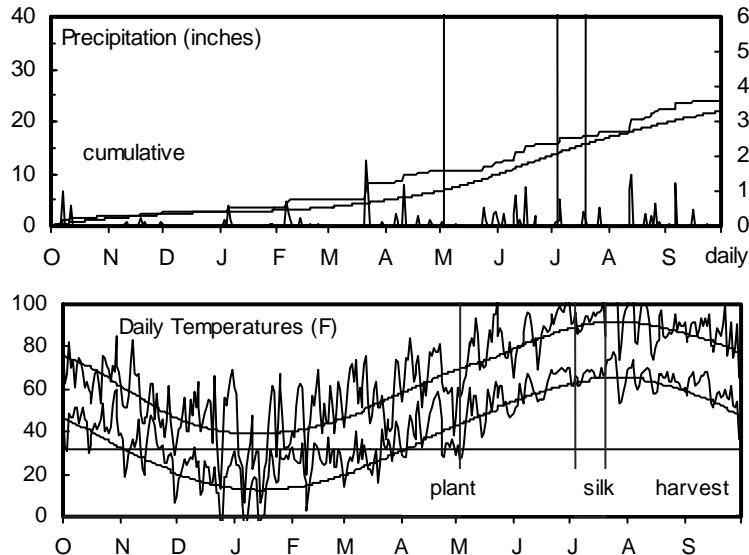

65 - 0 - 0 lb/a N, P, K

Planted on 5/3/2005; Harvested on 10/6/2005

Target stand of 17,000 plants/acre; 12.3 in. spacing

Good germination and emergence were followed by adequate spring growth. May and June had favorable precipitation and temperatures. Hot, dry conditions after silking in July and again in late August caused a rapid deterioration in plant health.

## NORTHWEST KANSAS NO-TILL DRYLAND CORN TEST

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Wheat in 2004

110 - 0 - 0 lb/a N, P, K

Planted on 5/4/2005; Harvested on 9/28/2005

Target stand of 19,000 plants/acre; 11.0 in. spacing

Good vegetative growth until silking. Hot and dry from mid-July through August during pollination and grain fill. Less than 1.25" of rain fell during this period.

## WEST CENTRAL KANSAS NO-TILL DRYLAND CORN TEST

Southwest Research-Extension Center, Tribune; Alan Schlegel, agronomist

Ulysses silt loam; Wheat in 2004

109 - 30 - 0 lb/a N, P, K

Planted on 5/9/2005; Harvested on 9/27/2005

Target stand of 17,000 plants/acre; 12.3 in. spacing

Planted no-till into good moisture. Temperatures were high during pollination. No insect or disease problems observed.

## NORTHWEST KANSAS IRRIGATED CORN TEST ON SILT LOAM SOIL

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Sunflower in 2004

250 - 50 - 0 lb/a N, P, K

Planted on 5/5/2005; Harvested on 10/17/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Good stands were established, and growing conditions were generally favorable throughout the growing season. Temperatures were high during pollination. Harvest conditions were very good, with few lodged plants or dropped ears. Insecticide was applied twice to control spider mites.

## WEST-CENTRAL KANSAS IRRIGATED CORN TEST ON SILT LOAM SOIL

Southwest Research-Extension Center, Tribune; Alan Schlegel, agronomist

Ulysses silt loam; Sorghum in 2004

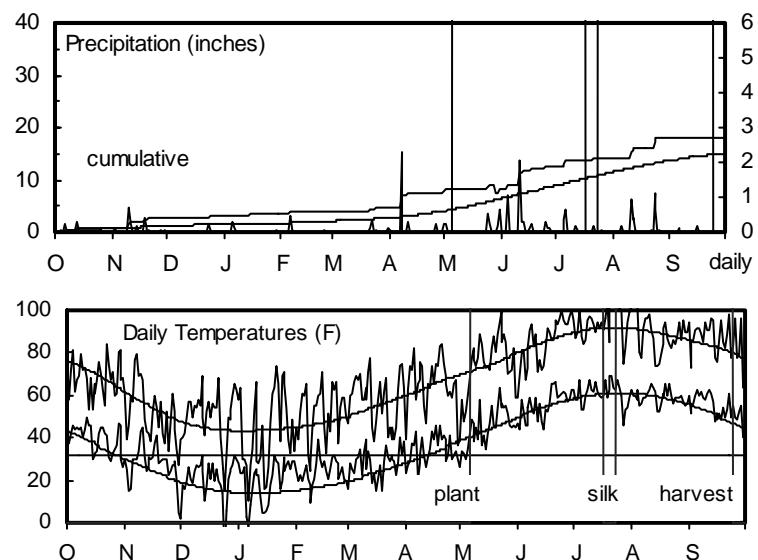

252 - 40 - 0 lb/a N, P, K

Planted on 5/6/2005; Harvested on 9/23/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Planted no-till into good moisture. Hail on August 19 stripped most of the leaves. No insect or disease problems were observed.

## SOUTHWEST KANSAS IRRIGATED CORN TEST ON SILT LOAM SOIL

Southwest Research-Extension Center, Garden City; Monty Spangler

Keith silt loam; Soybean in 2004

200 - 0 - 0 lb/a N, P, K

Planted on 4/27/2005; Harvested on 10/20/2005

Target stand of 30,000 plants/acre; 7.0 in. spacing

Dry soil at planting caused uneven emergence, but plots filled in after a rain 2 weeks later. Rainfall was relatively heavy in late May and early June. Hail on July 4 severely shredded leaves and broke tops out of several plants just before tassel and silk, eventually reducing plant heights and yields.

\* C=Cruiser®, P=Poncho®, LHB=Latitude® hopper box treatment containing Gaucho®. Numbers indicate rates if available.

\*\* Unless two varieties differ by more than the LSD, little confidence can be placed in one being superior to the other.

Yields in bold are in the top LSD group.

\*SD TRT = Seed treatment (C=Cruiser®, P=Poncho®, LHB=Latitude® hopper box treatment containing Gaucho®. Numbers indicate rates if available); GDD = growing degree days; DBL = days to black layer; RES = herbicide, disease, and insect resistance traits (Bt, BtCB, YG, YGCB, Hx = transgenic corn borer protection; BtRW, YGRW, HxRW = transgenic rootworm protection; CL, IT, IMI = imidazolinone resistant/tolerant; LL = Liberty Link; RR = Roundup Ready; GLS = gray leaf spot); P = prolific; F = flex ear. Values provided by entrants.

For those interested in accessing crop performance testing information electronically, visit our World Wide Web site. All of the information contained in this publication, plus more, is available for viewing or downloading.

Excerpts from the  
University Research Policy Agreement with Cooperating Seed Companies \*

Permission is hereby given to Kansas State University to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 949 '2005 Kansas Performance Tests with Corn Hybrids,' or the Kansas Crop Performance Test Web site, [www.ksu.edu/kscpt](http://www.ksu.edu/kscpt), for details. Endorsement or recommendation by Kansas State University is not implied."
