# 2010 CORN CROP REVIEW

## Statewide Growing Conditions

The Kansas corn growing season progressed rapidly in 2010, spurred by mostly favorable planting conditions in the spring and extremely hot temperatures during the summer. Frequent and sometimes heavy rains required that many acres be replanted, especially in southeast Kansas. Increased rainfall in the spring helped the topsoil moisture levels remain adequate throughout the state, with the exception of a two-week period in August when temperatures stayed in the triple digits (Figure 1). The nighttime temperature during those two weeks also stayed above average for that time of the year, forcing the corn crop to develop at an accelerated pace. Maturity and harvest were essentially finished by the end of September; a week ahead of the 5-year average and an entire month ahead of 2009.

Despite the stresses caused by the extreme heat, the quality of the 2010 corn crop remained good or fair for the duration of the growing season (Figure 2).

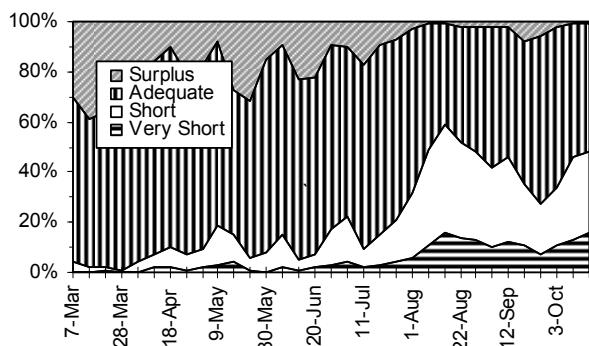

Figure 1. Statewide status of topsoil moisture.

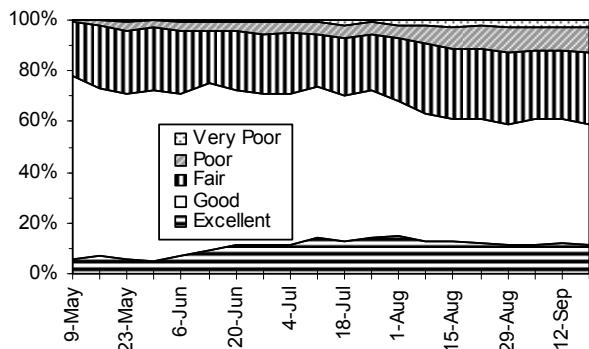

Figure 2. Condition of 2010 Kansas corn crop.

(Crop-Weather Reports, Kansas Agricultural Statistics Service, Topeka)

## Harvest Statistics

The October 8 Crops Report predicted a 585.0 million-bushel crop, down 2% from last year's record production of 598.3 million bushels. The anticipated number of acres to be harvested for grain is 4.5 million, up 17% from 2009. If realized, this will be the highest harvested area since 1933. The predicted average yield of 130 bushels per acre is down 8 bushels from last year. (Kansas Agricultural Statistics Service, Topeka)

## Diseases

From a plant health standpoint, 2010 presented a little bit of everything in terms of crop diseases, but without any single disease being epidemic. Early in the season, cool, wet weather caused planting delays and in some cases replanting. Some of the replanting, or poor stands where replanting was not an option, were the result of Pythium seedling blight.

At midseason, common rust occurred at above normal levels, causing some confusion with southern rust. Common rust typically is not a yield-limiting disease, but southern rust can be. Southern rust was detected for the first time in Labette County on July 30<sup>th</sup>, which is about the time it normally arrives in Kansas. No serious outbreaks of the disease were reported during the growing season. Gray leaf spot was present at economic levels in some fields across the state, mostly in those that were in corn continuously and especially where no-till was being practiced.

Late in the season, stalk rots were common in many fields across the state. In areas where extended periods of hot, dry weather occurred from mid-July through mid-August, charcoal rot was common. In other fields, Fusarium stalk rot was found more frequently.

A number of fields, particularly in the eastern half of the state, had low to moderate levels of Diplodia ear rot. This fungus is common in years when frequent rainfalls occurs at pollination time. Some Aspergillus ear rot, the cause of aflatoxin, was found in the Manhattan area, but surveys indicated that it did not appear to be a widespread problem across the state.

Numerous soil and root samples were analyzed for nematodes throughout the season. For most samples, levels of nematodes were below economic thresholds. Nematode species present included root lesion, stunt, dagger, stubby root, spiral and sting.

Other corn diseases reported include anthracnose, Physoderma brown spot, Goss's bacterial wilt and common smut. (Doug Jardine, Kansas State University Department of Plant Pathology)

## Insects

Insect problems in corn during the 2010 growing season consisted mainly of whorl feeding by a variety of caterpillars. The predominant species responsible were fall armyworms and corn earworms. This type of early season feeding causes concern among growers because the leaf feeding is very apparent and often results in a ragged-looking plant, but rarely results in yield reductions.

Spider mites were problematic in western Kansas, but growers there are experienced in dealing with these pests so they are not surprised when chemical treatments are required to reduce the populations. (Jeff Whitworth, Kansas State University Department of Entomology)

## 2010 PERFORMANCE TESTS

### Objectives and Procedures

Corn performance tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and seed industry personnel with unbiased agronomic information on many of the corn hybrids marketed in the state. Entry fees from private seed companies finance the tests. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown uniformly at all test locations. Most companies submit seed treated with systemic insecticides which can affect yield in some situations. A column listing insecticide seed treatments for each hybrid is included in Table 9 to help interpret yield results.

Three to four plots (replications) of each hybrid were grown at each location in a randomized complete-block design. Each harvested plot consisted of two rows trimmed to a specific length, ranging from 20 to 30 feet at the different locations.

Explanatory information is given in summaries preceding data for each test. Tables 2 through 8 contain results from the individual performance tests. Hybrids are listed together by company name. A summary of growing season weather data is given for individual test discussions. Precipitation graphs include cumulative lines for 2010 and the 30-year normal, in addition to the daily rainfall amounts since last fall. Temperature graphs include daily maximum

and minimum temperatures compared with normal. General trends in precipitation and temperature relative to normal are readily observed in the graphs. A table with monthly totals and averages for the growing season also is included.

The growth unit, or growing-degree-day concept, was developed to measure the amount of heat available for growth and maturation. To calculate the daily accumulation, add the maximum and minimum temperatures for each day, divide by 2, and subtract a base temperature of 50. Any temperature below 50°F was considered to be 50, and any temperature over 86°F was considered 86.

Most corn tests were planted at a rate 10% to 20% in excess of the desired population and thinned only to remove doubles. Planting to stand enables evaluation of product performance for the entire growing season.

Grain yields are reported as bushels per acre of shelled grain (56 lbs/bu) adjusted to a moisture content of 15.5%. Yields also are presented as percentage of test average to speed recognition of highest-yielding hybrids. Hybrids yielding more than 100% of the test average year after year merit consideration. Adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

The percentage of lodged stalks is reported when appropriate. Severely lodged stalks or dropped ears that could not be picked up by normal harvest procedures were not included in yield. Because harvest often is delayed until latest-maturing entries are ripe, early and midseason hybrids can lose ears simply because they must wait well past their optimum harvest date. In most years at most locations, dropped ears constitute a very small portion of lodging and do not significantly affect yields.

Small differences in yield should not be overemphasized. Relative ranking and large differences are better indicators of performance. Least significant differences (LSD) are shown at the bottom of each table. Unless two hybrids differ by at least the LSD shown, little confidence can be placed in one being superior to the other. Yield values in the top LSD group in each test are displayed in bold. The coefficient of variability (CV) can be used in combination with the LSD to estimate the degree of confidence one can have in published data from replicated tests.

\* Seed treatment and hybrid traits located in Table 9.

\*\* Yields in bold in the top LSD group.

\*\*\* Unless two hybrids differ by more than the LSD, little confidence can be placed in one being superior to the other.

## NORTHEAST KANSAS SPRINKLER-IRRIGATED CORN TEST

Kansas River Valley Experiment Field, Topeka; Larry Maddux, agronomist; Charles Clark and William Riley, technicians

Eudora silt loam; Soybeans in 2009

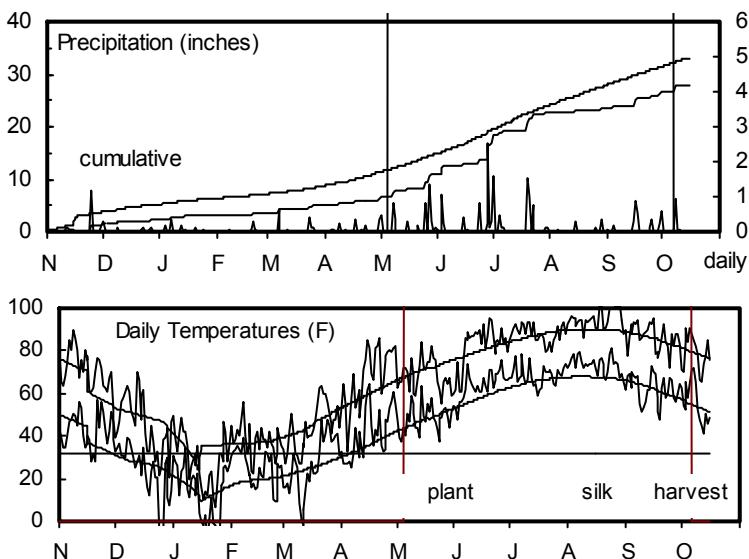

160 - 60 - 70 lb/a N, P, K

Planted on 4/20/2010; Harvested on 9/20/2010

Target stand of 26,000 plants/acre; 8.0 in. spacing

Uneven stands and emergence caused by heavy rains in the spring.

Month	Precipitation		Average Temp.		GDU	
	2010	Norm.	2010	Norm.	2010	Norm.

Totals:	28.1	31.6	55	54	4,043	3,627

Ashland Bottoms Research Center, Manhattan; Jane Lingenfelter, agronomist

Sandy loam; Soybeans in 2009

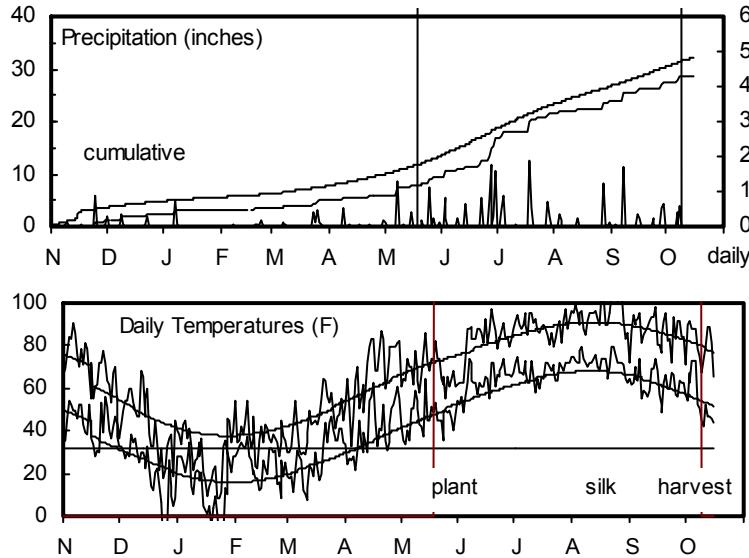

120 - 0 - 0 lb/a N, P, K

Planted on 5/4/2010; Harvested on 9/23/2010

Target stand of 30,000 plants/acre; 7.0 in. spacing

Strong storms in June caused extensive green snap.

	LSD (0.05)	24	12	1	2	1	2	13	13	2	1	1	1	25	11	2	2		

\* Seed treatment and hybrid traits located in Table 9.

\*\* Yields in bold in the top LSD group.

\*\*\* Unless two hybrids differ by more than the LSD, little confidence can be placed in one being superior to the other.

## EAST/CENTRAL KANSAS DRYLAND CORN TEST

East Central Kansas Experiment Field, Ottawa; Larry Maddux, agronomist; Jim Kimball, technician

Woodson silt loam; Soybeans in 2009

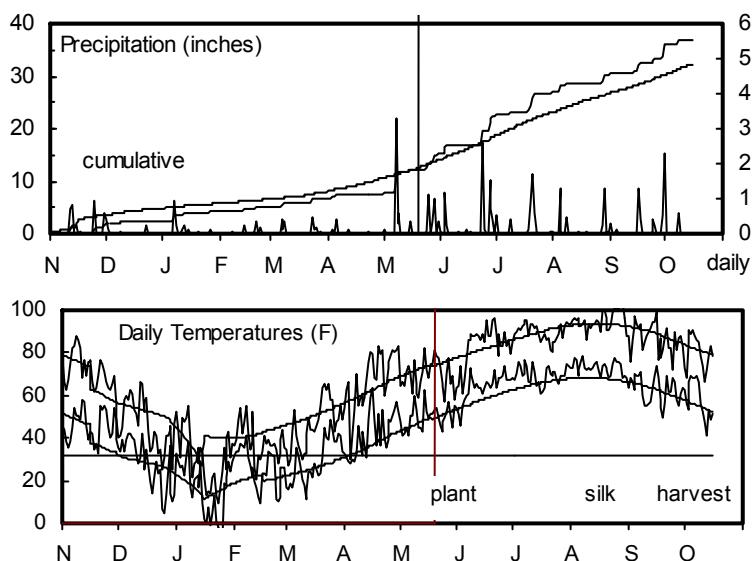

80 - 0 - 0 lb/a N, P, K

Planted on 5/5/2010; Harvested on 9/30/2010

Target stand of 23,000 plants/acre; 9.1 in. spacing

Uneven emergence and stands caused by heavy rains during the spring.

Month	Precipitation		Average Temp.		GDU	
	2010	Norm.	2010	Norm.	2010	Norm.
Nov.- Mar.	9.2	7.7	39	39	379	319
April	4.4	2.7	60	56	328	260
May	4.6	3.9	66	65	454	449
June	6.4	4.6	79	74	760	667
July	5.5	3.7	81	80	834	778
August	2.0	3.0	81	79	775	756
Sep.- Oct.	6.2	5.1	67	68	588	591
Totals:	38.3	30.8	57	56	4,118	3,820

Private farm, Erie; Kelly Kusel, research technician

Lanton silt loam; Soybeans in 2009

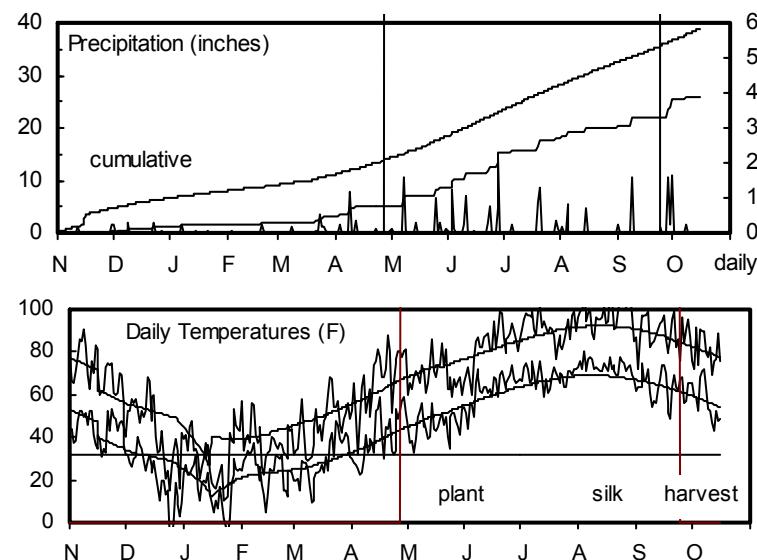

175 - 50 - 25 lb/a N, P, K

Planted on 4/13/2010; Harvested on 9/8/2010

Target stand of 25,000 plants/acre; 8.4 in. spacing

Uneven emergence due to dry ground at planting. Dry in early spring; weed control troublesome. Excellent growing conditions in June; July-August very hot and dry. Deer damage to some plots.

## EAST/CENTRAL KANSAS DRYLAND CORN TEST continued.

Private farm northwest of Topeka; Larry Maddux, agronomist; Charles Clark and William Riley, technicians

Silty clay loam; Soybeans in 2009

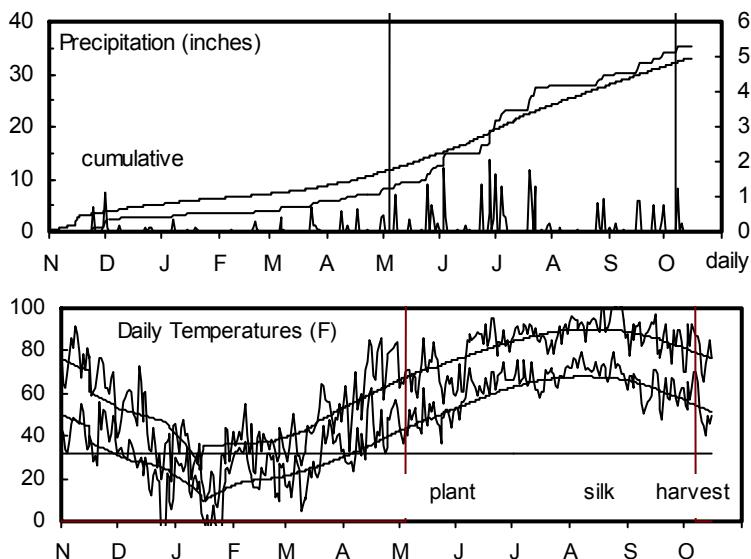

155 - 35 - 0 lb/a N, P, K

Planted on 4/20/2010; Harvested on 9/21/2010

Target stand of 22,000 plants/acre; 9.5 in. spacing

Uneven stands and emergence caused by heavy rains in the spring.

Month	Precipitation		Average Temp.		GDU	
	2010	Norm.	2010	Norm.	2010	Norm.

Sep.- Oct.	4.4	4.6	66	66	561	547
Totals:	35.5	31.6	55	54	3,971	3,627

Private Farm, Assaria; Clayton Short, cooperator; Jane Lingenfelser, agronomist

Smolan silt loam; Wheat in 2009

200 - 45 - 0 lb/a N, P, K

Planted on 5/7/2010; Harvested on 10/5/2010

Target stand of 18,000 plants/acre; 11.6 in. spacing

Drought stress during July and August limited yields.

\* Seed treatment and hybrid traits located in Table 9.

\*\* Yields in bold in the top LSD group.

\*\*\* Unless two hybrids differ by more than the LSD, little confidence can be placed in one being superior to the other.

## SHORT-SEASON DRYLAND CORN TEST

Four-State Farm Show, Pittsburg; Kelly Kusel, research technician

Parsons silt loam; Soybeans in 2009

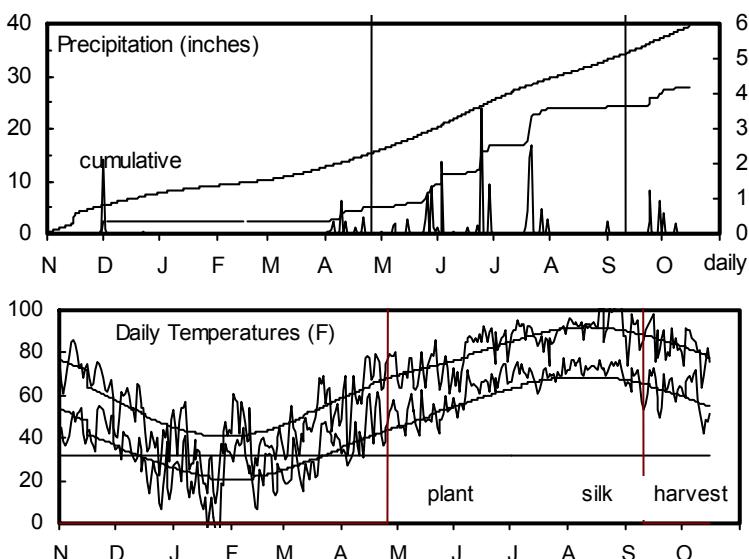

150 - 50 - 60 lb/a N, P, K

Planted on 4/12/2010; Harvested on 8/25/2010

Target stand of 22,000 plants/acre; 9.5 in. spacing

Excellent emergence. Excellent growing conditions in June, July and August were very hot and dry. Almost no lodging-excellent drydown.

Month	Precipitation		Average Temp.		GDU

## East Central Kansas Experiment Field, Ottawa; Larry Maddux, agronomist; Jim Kimball, technician

Woodson silt loam; Soybeans in 2009

80 - 0 - 0 lb/a N, P, K

Planted on 5/5/2010; Harvested on 9/30/2010

Target stand of 22,000 plants/acre; 9.5 in. spacing

Uneven emergence and stands caused by heavy rains during the spring.

\* Seed treatment and hybrid traits located in Table 9.

\*\* Yields in bold in the top LSD group.

\*\*\* Unless two hybrids differ by more than the LSD, little confidence can be placed in one being superior to the other.

## WEST KANSAS NO-TILL DRYLAND CORN TEST

Agricultural Research Center, Hays; Wayne Aschwege, agronomist

Harney clay loam; Sorghum in 2009

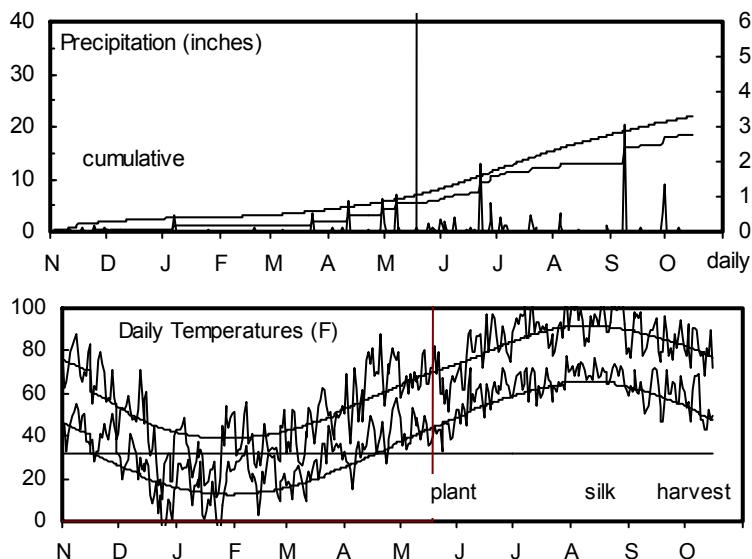

80 - 0 - 0 lb/a N, P, K

Planted on 5/4/2010; Harvested on 9/30/2010

Target stand of 17,000 plants/acre; 12.3 in. spacing

Good planting conditions. Wet spring; dry summer until harvest.

Month	Precipitation		Average Temp.		GDU

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Wheat in 2009

150 - 0 - 0 lb/a N, P, K

Planted on 5/4/2010; Harvested on 9/23/2010

Target stand of 17,000 plants/acre; 12.3 in. spacing

Good stands were established and above-normal rainfall through mid-August provided good growing conditions. Mid-August until harvest was hot and dry.

## WESTERN KANSAS IRRIGATED CORN TEST

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Sunflower in 2009

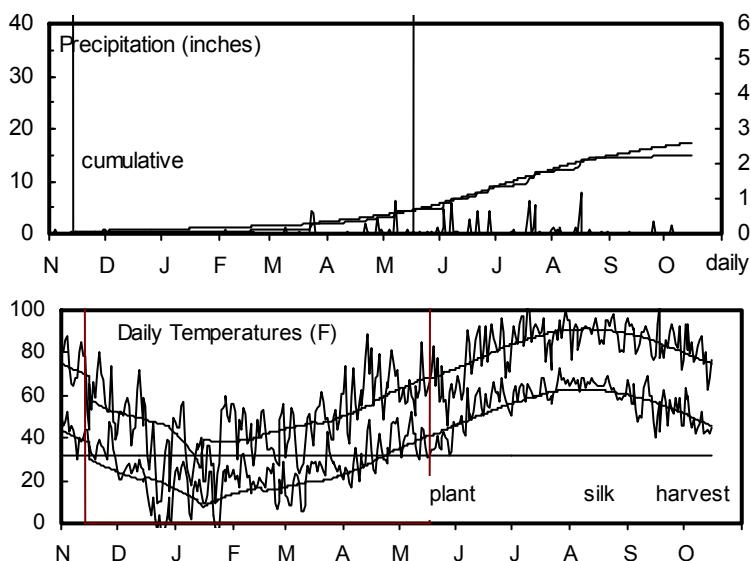

275 - 65 - 0 lb/a N, P, K

Planted on 5/3/2010; Harvested on 10/12/2010

Target stand of 30,000 plants/acre; 7.0 in. spacing

Very good growing conditions the entire season.

Month	Precipitation		Average Temp.		GDU

**Excerpts from the UNIVERSITY RESEARCH POLICY AGREEMENT  
WITH COOPERATING SEED COMPANIES\***

Permission is hereby given to Kansas State University to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1037 '2010 Kansas Performance Tests with Corn Hybrids,' or the Kansas Crop Performance Test Web site, [www.agronomy.ksu.edu/kscpt](http://www.agronomy.ksu.edu/kscpt), for details. Endorsement or recommendation by Kansas State University is not implied."
