Effect of Synovex-H and Ralgro Implants on Weight Gain of Heifers Grazing Wheat Pasture

Scott Laudert and Ricky Nelson

Summary

Heifer calves grazing winter wheat pasture and implanted with Synovex-H or Ralgro gained 18 and 14% faster ($P < 0.01$) respectively, than heifers not implanted. Weight gains were similar for both implants.

Experimental Procedure

One hundred and eighty-two straightbred and crossbred heifer calves averaging 415 lbs were randomly allotted by breed and purchase source to one of the following four treatments: 1) control (no implant); 2) Synovex-H inserted at the recommended site; 3) Synovex-H inserted at the base of the ear, or 4) Ralgro inserted at the base of the ear. Each heifer was individually weighed at the beginning and end of the 138 day trial. All heifers grazed together throughout the trial.

Results

Both implants increased ($P < 0.01$) rate of gain over that of the control heifers (Table 32.1). There were no significant differences among the implants, and there was no advantage to altering the site of implanting Synovex-H.
