CHAPTER 1

INTRODUCTION AND PROBLEM DEFINITION

Information processing is generally viewed as the manipulation and organization of information in a purposeful way. The advent of computers and their unique capability to store and manipulate vast quantities of information has enabled great advancements in the development of information processing systems. Most organizations, whether scientific or business, are faced with the problem of an information explosion and the computer is a very effective tool to help overcome this problem so that more time may be spent on meaningful and constructive work rather than on the tedious and irritating job of retrieving necessary information each time it is needed. Numerous information processing systems covering a wide range of areas such as the military, business, industry, medicine and education have been successfully developed and implemented. The basic objective underlying all these systems is to access the relevant information in as short a period as possible and to present it to the user in the form he desires.

It was with this objective in mind that the Exam Generation System was developed, and it is hoped that it would assist faculty or anyone associated with the teaching profession in constructing exams for their courses. This system will enable a user to create a database of questions and answers for a particular course, and to obtain a formatted printout of the questions by merely specifying the numbers of the questions he wishes to appear in an exam. The formatted exam will have answer space allotted for
each question and this allocation is controlled by the user. An output with
the solutions for the questions is also provided for the user's reference.

There might be criticism from certain quarters about such a system as
it could standardize the contents of the exams being generated. To counter
this, updating of the database has been made very convenient and the user
can make changes whenever he wishes to. This should hopefully lead to a
dynamic and healthy system.

The factors governing the design of the system are listed below:
1) It is general purpose in the type of data to be accommodated with
   a restriction on the record size (which could be modified by the
   user).
2) It enables the user to create a database on an auxiliary unit
   of his choice by supplying the data in the prescribed format.
3) It enables the user to add or delete data entries to the
   database.
4) It enables the user to obtain three types of printout.
   (i) A printout of the masterfile.
   (ii) A printout of the exam consisting of the questions
       retrieved on his request.
   (iii) A printout of the exam along with the solutions to the
       questions.
5) It operates in a batch environment.

**SYSTEM ENVIRONMENT**

The system uses the IBM 360/50 at the Computing Center, Kansas State
University, with peripheral units such as disk, tape, card reader and
line printer. The system is written in PL/1, and the database is a direct
access, regional (3) file with undefined length records.
CHAPTER 2

SYSTEM DESCRIPTION

2.1 Introduction

The Exam Generation System is split up into three programs:

(i) Program QACREAT - To create the database

(ii) Program QAUPDAT - To update the database

(iii) Program QAPRINT - To retrieve and print the questions specified for the exam.

These programs are invoked by the cataloged procedures QUIZGENC, QUIZENU and QUIZGENP.

Program QACREAT accepts character data from cards and processes it in accordance with the format code before storing it in the database. The database is initially created on disk and then moved to tape.

Program QAUPDAT updates the database, i.e. adds or deletes data entries. While adding, the data is to be processed in the same way as while creating the database. The question numbers identifying the records to be deleted are read in from cards and the source keys generated. The database is moved to disk updated and then moved back to tape.

Program QAPRINT retrieves questions identified by the question numbers which the user specifies. It then formats them and prints out the examination and the examination with solutions. A printout of the masterfile is also provided if the MASTFIL option is turned on.

The outline of the system is shown in the next section.
2.2 OUTLINE OF THE SYSTEM

DATA BASE CREATION

DATA BASE UPDATING
EXAM GENERATION
2.3 DATA BASE CREATION

The database is created by invoking the cataloged procedure QUIZGENC which accepts character information punched on cards and operates on it according to the format code before storing the information in the database. The database is a direct access, keyed, regional (3) file with record length undefined. The reasons for choosing regional (3) organization are discussed in a later part of this chapter.

The procedure for creating the database can be thought of as consisting of the following main steps:

1. Reading in data from cards.
2. Operating on the data according to the format code for convenience and efficiency while storing.
3. Generating a source key which will enable direct retrieval of a record when needed.
4. Storing the processed information in the database.
5. Moving the database to a tape unit.

Step 1: The data is read in from cards, 80 characters at a time. End of each data entry is indicated by the symbol $END.

Step 2. Two format codes 'U' and 'D' which determine the form in which the question is to be printed are available. A default code value of 'D' is assumed in the event of the user not specifying a format code. Format code 'U' indicates that the user wants his data on each card to be reproduced on a fresh line without suppressing the blanks preceeding the information on a card. Format code 'D' indicates that all blanks preceeding and following the information on a card can be suppressed and that the
information need not begin in a fresh line. The maximum length of the line is fixed at 50 and hence when reproduced it will have as many 50 character lines as possible and the remaining information placed, left justified in the line.

It is convenient to store and manipulate the information pertaining to a question in a single logical record. To enable this the data read in, is first operated upon. It is also desirable to conserve storage space by suppressing blanks preceeding and following the relevant information on a card. In the case of format 'D', the relevant information from a card is isolated and concatenated with information on successive cards of the data entry since data on a card need not begin in a fresh line. However in the case of format 'U' it is necessary that a special character '@' be inserted on the disk and tape records at the right of the information from each card indicating the beginning of a fresh line. Also, in this case the blanks preceeding the information on a card are left intact since this is useful for data in the form of a program where the logical structure is to be preserved.

Step 3: The database as mentioned earlier is a regional (3) organization. The major advantage of this over other types of database organizations is that it allows control over the relative placement of records. The source key which identifies each record can be thought of as having two logical parts, the region number and a comparison key. The rightmost eight characters of the source key make up the region number. The question number is assigned to the data entries in the ascending order and serves as the comparison key. An algorithm which derives a region number from the question number is designed in such a way as to optimize the use of space within the
dataset. Duplicate region numbers will occur, but their only effect may be to lengthen the search time for records with duplicate region numbers.

The algorithm used is a hashing technique which translates the question number to a corresponding unique memory location, i.e.,

\[ \text{Region number} = \text{MOD(Question number/10)}. \]

The question number concatenated with the region number forms the source key of each record. This algorithm generates ten records with identical region numbers. Since each region number corresponds to a track on the disc, the 2314 unit with a track capacity of 7244 bytes will accommodate ten records, with an average length of 720 bytes. If overflow occurs, the system searches the next track until it finds empty space. It is advisable to limit track overflows for efficiency in execution.

Step 4: The processed information along with question number, space code, and the format code is stored in the database in a location determined by the source key.

Step 5: The database created on disk is then moved to a tape unit specified by the user. IBM utility program IEHMOVE performs this operation, and since the devices are not compatible, it unloads the database maintaining the regional organization and then moves the database.

**Additional features:**

1. If any of the codes (space or format) are omitted, then a message indicating the default value assumed for a data entry is printed

2. A listing of the masterfile of questions and answers is provided to the user in the form in which they will be reproduced when retrieved for generating an examination.
2.4 DATA BASE UPDATING

The database can be updated by invoking the cataloged procedure QUIZGENU. Two update operations, ADD and DELETE, are available. Also the number of data entries to be added or deleted has to be specified. All update operations are performed on disk, and the dataset has to be moved to disk from tape and after updating moved back to tape.

The procedure for adding a data entry is the same as that described in Section 2.3, except that steps 3 and 4 are performed by a subroutine, ADD. The question numbers assigned to the data entries are in sequence with the numbers already existing in the dataset.

The procedure for deleting a data entry can be thought of as consisting of the following steps:

1. Reading in the question numbers identifying the records to be deleted from cards.
2. Generating source keys using the hashing technique described in Section 2.3.
3. Deleting the records identified by the source keys.

Subroutine DELETE performs steps 2 and 3 and is passed the question numbers read in through an array argument.

The update operations are to be specified in the PARM parameter passed to the PL/1 main procedure. The data specified in the PARM parameter field can be up to 100 characters long and must be enclosed in quotation marks. Section 3.4 of the user's manual contains a detailed description of the parameter specification. The PL/1 program scans the PARM parameter and isolates the operations specified for that particular run.
Additional Features:

1. A message indicating the question numbers added or deleted is printed.

2. A listing of the updated masterfile of questions and answers is provided to the user in the form in which they will be reproduced when retrieved for generating an exam.

3. An ON KEY condition is enabled to take care of errors in specification of question numbers by the user while deleting data entries. A diagnostic message is generated informing the user that the data entry referred to does not exist in the dataset.
2.5 EXAM GENERATION

An exam can be generated by invoking the cataloged procedure QUIZGENP. The name of the dataset from which the questions are to be retrieved and the tape unit on which it resides are to be specified by the user. Also, the print options which are explained in detail in Section 3.4 of the user's manual should be specified by the user. However, a default value of QUESFIL is assumed in the event of the user not specifying an option.

The procedure for generating an exam can be though of as consisting of the following steps:

Step 1. Reading in the question numbers identifying the records to be printed out for the exam.

Step 2. Generating source keys using the hash technique described in the earlier Section 2.3.

Step 3. Retrieving records corresponding to these source keys and formatting the information in a record according to the format code.

Step 4. Printing the exam providing answer space for each question in accordance with the space code.

Steps 1 and 2 have been described in earlier sections.

Step 3: The record retrieved contains the information which has been pre-processed while creating the database. Hence the formatting operation differs depending on the type of format specified for this record. In the case of format 'D', the record is broken into as many 50 character blocks as possible and the remaining information padded with blanks to the right to make up a 50 character block. These blocks are printed out successively in Step 4, and answer space is provided by skipping a number of lines, which is determined by the space code before printing the next question.
In the case of format code 'U', the record is searched for the special character '@' and the information preceding each '@' moved to a block of 80 characters. Blanks are padded at the right if the information is less than 80 characters. These blocks are printed out in the same way as in the previous case in Step 4.

The questions, when printed out, are numbered serially starting with 1. The title information is printed out if provided and also an 'EXAM #' and 'DATE'.

Additional features:

1. A printout of the questions along with their answers is also provided to the user each time an exam is generated. This option is turned on by default.

2. A printout of the masterfile can be obtained by turning the MASTFIL option on Section 3.4 of the user's manual contains more details.

3. If the user specifies a question number referring to a record which does not exist in the dataset, a diagnostic message is generated.
KANSAS STATE UNIVERSITY

USER'S MANUAL

FOR

QUIZGEN

Programmed by: KOKA RAVINDRA

ABSTRACT

QUIZGEN is a set of PL/1 programs which is designed to enable:

1) Creation of a database of questions and answers on an auxiliary unit.
2) Updating of the database created.
3) Generation of a formatted exam.

TABLE OF CONTENTS

1. Introduction
2. JCL requirements
3. Parameter description
4. Data formats
INTRODUCTION

1. This manual is designed to provide the user the rudimentary information required to utilize the programs QACREAT, QAUPDAT, and QAPRINT which are invoked by the cataloged procedure QUIZGEN. These are a set of programs in PL/1 which enables the user to create a database of questions and answers on tape by providing the data on cards, and then to retrieve questions from this database to generate a formatted exam with answer space provided for each question. It also enables the user to update the database by providing the necessary control and data.

Program QACREAT reads in the character data punched on cards and, after operating on it, stores it in the database. The name of the database created and the tape unit on which it is to reside should be specified by the user.

Program QAPRINT will access the database created by the previous program and will retrieve those records which the user identifies by specifying question numbers. The exam is generated by this program and will consist of the retrieved questions. It will also provide the user with a printout of the exam with solutions for his reference. Print options are discussed in detail in Section (3.4).

Program QAUPDAT will add or delete data entries. The update operations and the data should be specified by the user. The program provides the user with a listing of the updated masterfile.
JOB CONTROL LANGUAGE (JCL) REQUIREMENTS

2. The Job Control Language (JCL) necessary to utilize the programs discussed in Section 1 is listed below. The various parameters on the EXEC card, the MOVE and COPY control cards and the data formats for the three programs are described in Sections 3 and 4.

Program QACREAT:

//Jobname JOB (see KSU Computing Center User's Guide)
// EXEC QUIZGENC,NAME=xxxx,[S=yyyy],
// TAPE=uuuu,[PARM.CREATE='www']
//CREATE.SYSIN DD *

/ * data (questions and answers) *

/*

//MOVE.SYSIN DD *

MOVE DSNAME=xxxx,TO=TAPE9=uuuu,FROM=2314=111111

/*

The parameters in square brackets are optional and if omitted, default values which are explained in Section 3, are assumed.
Program QAUDDAT:

//Jobname JOB (see KSU Computing Center User's Guide)
// EXEC QUIZGENU,NAME=xxxx,TAPE=uuuu,
// PARM,UPDAT='www'
//MOVE,SYSSIN DD *

MOVE DSNAME=xxxx,TO=2314=111111,FROM=TAPE9=uuuu
/*

//UPDAT,SYSSIN DD *

data
/*

//MOVE2,SYSSIN DD *

MOVE DSNAME=xxxx,TO=TAPE9=uuuu,FROM=2314=111111
/*
Program QAPRINT:

//Jobname JOB (see KSU Computing Center User's Guide)

// EXEC QUIZGENP,NAME=xxxx,TAPE=uuuu,

// [PARM.PRINT='www']

//MOVE.SYSIN DD *

COPY DSN=xxxx,TO=2314=111111,FROM=TAPE9=uuuu

/*

//PRINT.SYSIN DD *

  data (question No's of the questions to be printed out)

*/
PARAMETER DESCRIPTION

3.1 NAME=xxxx Where xxxx is the name of the dataset which is created by invoking the cataloged procedure QUIZGENC consisting of the data provided by the user. This dataset will be moved to tape and saved for future use. The name of the dataset should be specified while invoking any one of the cataloged procedures QUIZGENU, QUIZGENP and QUIZGENC.

NOTE: The name should be enclosed in apostrophes if it contains any special characters.

EXAMPLES:

1) NAME = QUES600
2) NAME = 'CODP07.BREWER'

3.2 S=yyyy Where yyyy is the space parameter and specifies the space to be allocated for the dataset being created by QUIZGENC. It is optional and if omitted a default value will be assumed.

NOTE: The space value has to be enclosed in apostrophes. The default value is (1000, (15, 10)) and will accommodate 15 data entries with an average record length of 1000.

EXAMPLES:

1) S = '(TRK,(1,1))'
2) S = '(CYL,(1,1))'
3.3 TAPE=uuuu Where uuuu is the volume serial number of the tape unit on
which the dataset is to reside. The dataset is initially
created on disc and then moved to a user specified tape unit.
The tape unit number should be specified while invoking any
one of the cataloged procedures QUIZGENC, QUIZGENU or
QUIZGENP so that the dataset can be accessed.

NOTE: The number should be enclosed in apostrophes, if it contains
special characters.

EXAMPLES:
1) TAPE = 000506
2) TAPE = '2400-6'

3.4 PARM OPTIONS

The PARM parameter can be used to pass information to
the program steps in the cataloged procedure. The
various options provided in the three programs are
described below.

Program QACREAT (QUIZGENC)

NO TITLE This option is provided so that the user need not provide
title information for his database, if he chooses to. This
option is to be passed to the CREATE step of the cataloged
procedure QUIZGENC and has to be enclosed in apostrophes.
If omitted, it is assumed that title information is being
provided by the user.

EXAMPLE: PARM.CREATE = 'NO TITLE'
Program QAUPDAT (QUIZGENU)

ADD This option enables the user to add data entries to his database. The number of data entries to be added is to be specified and the format for that is 'ADD= no' where no is an integer number. If no is omitted then 1 is assumed. This option should be passed to the UPDAT step of QUIZGENU.

DELETE This option enables the user to delete existing records from his database. The number of records to be deleted is to be specified, just like in ADD and the format is 'DELETE=no' where no has the same meaning as before. This option is also passed to the UPDAT step of QUIZGENU. If no is omitted, then 1 is assumed.

NOTE: If both options ADD and DELETE are specified, then they should be separated by commas. There is no restriction on the order in which they are to be specified. At least one option has to be specified.

EXAMPLES:

(i) PARM.UPDAT = 'ADD,DELETE'
    This indicates that one record is to be added and one to be deleted.

(ii) PARM.UPDAT = 'ADD=3'
    This indicates that three records are to be added.

(iii) PARM.UPDAT = 'ADD=2,DELETE=4'
    This indicates that two records are to be added and four deleted.
Program QAPRINT (QUIZGENP)

MASTFIL This option enables the user to obtain a formulated listing of the masterfile of questions and answers, in ascending order of the question numbers. This option is to be passed to the PRINT step of the cataloged procedure QUIZGENP and has to be enclosed in apostrophes. This option is turned off by default and has to be enabled.

QUESTFIL This option enables the user to obtain a formatted exam and also a listing of the exam with the solutions. This option is turned on by default and has to be specified only if the default option is being overridden by the user. This also is to be passed to the PRINT step in QUIZGENP.

NOTE: Specification of an option overrides the default option.

EXAMPLES:

(i) PARM.PRINT = 'MASTFIL'
(ii) PARM.PRINT = 'QUESTFIL'
(iii) PARM.PRINT = 'MASTFIL,QUESTFIL'

In (i) the masterfile listing will be provided and in (ii) the formatted exam and the formatted exam with solutions will be printed out. In (iii) both the printouts of (i) and (ii) will be provided.
3.5 MOVE and COPY control cards:

MOVE DSNAMES, TO=TAPE9=uuuu, FROM=2314=111111
COPY

xxxx is the name of the dataset to be moved and is the same as that described in Section 3.1.

uuuu is the volume serial number of the tape unit to which the dataset is to be moved. It is the same as that mentioned in Section 3.3.

NOTE: MOVE deletes the dataset from the device from which it is being moved.
COPY leaves the dataset as it is on the device from which it is copied.
DATA FORMATS

4.1 Program QACREAT (QUIZGENC)

**Title Information:** This information is optional and if supplied, should precede all other data. The information consists of the following:

1. Course number
2. Course title
3. Name of the Instructor.

It should be in the above order and the information should be enclosed in apostrophes. The course number should not be longer than seven characters. The course title and Instructor's name can be of any length. If the user chooses to omit any of the information, then he should place a blank in that portion. The NO TITLE option should be turned on if he chooses to omit all title information.

**EXAMPLES:**

'286-600' 'DISCRETE STRUCTURES' 'R.K.BREWER'

'286-600' '' 'R.K.BREWER'

**DATA ENTRY**

The title information, if provided, should be followed by the data entries which consists of sets of questions and answers. Every question should start in a fresh card but may start in any column. The last card in the set of cards pertaining to a particular question and answer should contain $END$. If there is no blank space on the last card, then an extra card with $END$ in it should be included. The format code, space code and
answer are optional and can be omitted if the user chooses. The format for specifying these is given below.

The format code should be a single alphabetic character and the space code should be an integer number. They should be preceded by two ampersands, if specified. The format code should always precede the space code if both are specified. If an answer is being supplied, then it should be preceded by &ANS.

**FORMAT CODE:** &U or &D

- U indicates that the user wants his data to appear exactly as he has punched them on cards. Preceding blanks will not be suppressed.
- D indicates that the user wants his data to appear in consecutive lines with 50 characters in a line. All preceding and following blanks in a data card will be suppressed.

If the format code is not specified by the user then it defaults to D.

**SPACE CODE:** &&number

The number can be any integer number and indicates the number of lines of blank space required for the solution of that particular question.

If the user does not specify a space code, then it defaults to 2.
EXAMPLES:

(i) \$6\&U \&5 WHY IS THE SKY BLUE \&ANS BECAUSE \IT IS NOT RED $END

(ii) \$6\&3 WHY IS THE SKY BLUE $END

(iii) WHY IS THE SKY BLUE $END

4.2 Program QAUPDAT (QUIZGENU)

There are two data formats corresponding to ADD and DELETE operations.

ADD: The data format is the same as that described in 4.a except that there is no title information.

DELETE: The question numbers of the questions to be deleted are to be specified and they should be separated by blanks. They should start in a fresh card and can be continued on successive cards.

NOTE: The data for ADD and DELETE should be in the same order as specified in the parm option of QUIZGENU.

EXAMPLES:

(i) For PARM.UPDAT='ADD,DELETE=3' the format would be

Card 1      WHY IS THE SKY BLUE $END

Card 2       5 6 8
(ii) For PARM.UPDAT='DELETE=4,ADD' the format would be

Card 1  5 6 8 10
Card 2  WHY IS THE SKY BLUE $END

4.3 Program QAPRINT (QUIZGENP)

The data consists of the question numbers which are to be printed out for that particular exam. The question numbers should be separated by at least one blank and should start in a fresh card. They can be continued on successive cards.

EXAMPLES:

(i)  1  4  10

Questions 1, 4 and 10 of the masterfile will appear in the exam in this case.

(ii)  11  8  25  10  12

Questions 11, 8, 25, 10 and 12 will be printed out in the exam.
APPENDIX A.1

This is the output obtained by invoking the cataloged procedure QUIZGENC. It shows the masterfile created.

1) Write a PL/1 Algorithm to create a doubly linked list.

2) TT:
   PROC OPTIONS (MAIN);
   DCL A CHAR(11);  
   CALL START;
   GET LIST(A);
   I=MAK(A);
   PUT LIST(A,I)
   IF I<0 THEN
       I=MAK(A);
   PUT LIST(A,I);
   GOTO AA;

START:
   PROC:
   DCL [I,J,K,LINK(0:100,2)] FIXED BIN;
   DCL A CHAR(*), (WORD,X(0:100)) CHAR(30) STATIC;
   LINK=0;
   X=' '
   I,J=0;
   K=1;
   RETURN;

LUK:
   ENTRY(A) RETURNS(FIXED BIN);
   I=1;
   WORD=A;
   RE:
   IF WORD=X(1) THEN
       RETURN(-1);
   IF WORD>X(1) THEN
       K=2;
   ELSE
       K=1;
   IF LINK[I,K]=0 THEN
       RETURN(-1);
   ELSE
       T=LINK[I,K];
   GOTO RE;

MAK:
   ENTRY(A) RETURNS(FIXED BIN);
   WORD=A;
   J=J+1;
   X(J)=WORD;
   LINK[I,K]=J;
   RETURN(J);
   END START;
   END TT;

/* The entry "LUK" is always used, both in searching the list X and */
/* in adding to it. When an item is to be added to the list, LUK is */
/* invoked. If a minus return is obtained, the item is not on the */
/* list and MAK is invoked, adding the item to the list. Multiple */
/* copies of a word may not be put on the list. */

A) Given the above code, what sort of list does it build? (4 pts)
B1) Given the following input that is assumed added to the list one item at a time, graph the resultant list. (4 pts)

MJOCPXDBWTSKAZ

3) Given storage blocks of 3000, 2000, and 1000 units, respectively, would the best fit or first fit strategy allow the maximum allocations given requests of 1000, 2000, and 3000 units, respectively? Which is usually the best strategy according to Knuth?

A) ____________________________ (1.5 pts)

B) ____________________________ (1 pt)

4) Give locia j, k, i, if a is the matrix given, and if each node of the li9jho is a words long, assuming the nodes are stored consecutively in lexicographic order of the indices. n=4, m=5, j=2, k=3 (10 pts)

5) Given the following list, graph it and give a memory representation using head d, singly linked, non-circular list representation. (9 pts) L=( ; l; ; n; ; ; ; i; i;)

j) n=( ; (j); ; (i))

6) Given the following tree:
   a) Thread it in post order. (9 pts)
   b) Give the ps of the node containing f. (hint: *s, m, r are pre, pos & end) (2.5 pts)
   c) Give the pre and end order traversals of the tree. (4 pts)

7) Which of the following do not match?
   sun: heat
down: lunatic
girl: emotion
place: sentiment
mind: haystack

8) If the following tree is added to the right of the tree in 10;
   a) give the naturally corresponding binary tree to that forest. (4 pts)
   b) give the postorder sequential representation of it.

9) Given the following code and data,
   device:proc options (main);
   dcl array (101) char (11);
   dcl (n, op) char (11);
   j, k=51;
   a; get edit (op) (a(11));
   if op='*', then goto l99;
   if op='b' then
   do;
   put list (array(k));
   k=k-1;
   goto a;
   end;
   get edit (n) (a(11));
   if op='r' then
   do;
   k=k+1;

1  2  3  4  5  6  7  8  9  10  11  12  13  14  15  16
ARRAY(K)=N;
END;
ELSE
DO;
ARRAY(J)=N;
J=J-1;
END;
GOTO A;
L99;
END DEVICE:
A1B2CDA3A4H5B6C7A8CDCC
A) GIVE THE FORMAL NAME OF THE DEVICE IT SIMULATES. (2.5 PTS.)

B) GIVE THE OUTPUT RESULTING FROM THE INPUT STRING GIVEN, ASSUMING THAT A MEANS INSERT AT END X, B INSERT AT Y, C DELETE AT X, D DELETE AT Y, (4 PTS)

C) CAN THE INPUT ITEMS, DISREGARDING THE LETTERS BUT RETAINING THE ORDER OF ITEMS, BE PERMUTED TO 72456837? (5 PTS)

D) IF LINES 14, 19-23 ARE REMOVED, WHAT WOULD THE DEVICE BE CALLED? (2.5 PTS)

E & F) WHEN THEY ARE REMOVED, WHAT ARE THE ANSWERS TO 1B AND 1C ABOVE? (4 PTS AND 5 PTS)

10) GIVEN N=7 AND BASED[I]=TOP[I]=L =C FOR UC=IC=N AND BASE(N+1)=L =C, C=2 AND L =L /C IS 100. WHAT WILL HAPPEN GIVEN THE FOLLOWING ACTIONS TAKEN SEQUENTIALLY: INDICATE A NORMAL INSEPTION OR DELETION WITH THE LETTER I OR D, OVERFLOW AND UNDERFLOW WITH O OR U. ASSUME REPACKING WILL TAKE PLACE WHEN CALLED FOR. (4 PTS)

13__
D3__
14__
18__
D8__
D4__
17__
D1__
I1__
I3__

11) DESCRIBE PARTIAL ORDERING (IN OTHER WORDS, WHAT IS A PARTIALLY ORDERED SET?) (4 PTS)

12) GIVEN TWO DISJOINT CIRCULAR LISTS, L1 AND L2 POINTED TO BY PTR1 AND PTR2 RESPECTIVELY, SHOW THE INSERTION OF L2 AT THE RIGHT OF L1. USE L1=A, B, C, D AND L2=E, F, G, H. BE SURE TO SHOW BOTH THE BEFORE AND AFTER DIAGRAMS, INCLUDING THE POINTERS. (10 PTS)

13) WHY IS THE SKY BLUE?
ANS: BECAUSE IT IS NOT RED
14) WHO IS THE PRESIDENT OF THE U.S?
ANS: RICHARD NIXON
APPENDIX A.3

This is the output obtained by invoking the cataloged procedure QUIZGENP. It shows the exam printed and the exam with solutions.
FILE TO BE PRINTED NOT SPECIFIED. QUESTIL ASSUMED.
1) GIVEN STORAGE BLOCKS OF 3000, 2000, AND 1000 UNITS, RESPECTIVELY, WOULD THE
BEST FIT OR FIRST FIT STRATEGY ALLOW THE MAXIMUM ALLOCATIONS GIVEN REQUESTS OF
1000, 2000, AND 3000 UNITS, RESPECTIVELY? WHICH IS USUALLY THE BEST STRATEGY
ACCORDING TO KNUTH?

A) _________________________ (1.5 PTS)

B) _________________________ (1 PTS)

2) WHICH OF THE FOLLOWING DO NOT MATCH?
   
   SUNDAY: HAYSTACK
   
   SUN: HEAT
   
   MOON: LUNATIC
   
   GIRL: EMOTION
   
   PLACE: SENTIMENT
   
   MIND: HAYSTACK

3) GIVEN THE FOLLOWING CODE AND DATA,
   
   DEVICE: PROC OPTIONS (MAIN);
   
   DCL ARRAY (101) CHAR (11);
   
   DCL (N,DP) CHAR (11);

   ARRAY(J)=N;
   
   J=J-1;
   
   END;
   
   GOTO A;
   
   L99;
   
   END DEVICE;

   A192CDA3A45R4B7A8BCD000

   A) GIVE THE FORMAL NAME OF THE DEVICE IT SIMULATES, (2.5 PTS.)

   B) GIVE THE OUTPUT RESULTING FROM THE INPUT STRING GIVEN, ASSUMING THAT A
MEANS INSERT AT END, B INSERT AT Y, C DELETE AT X, D DELETE AT Y, (4 PTS)
C) CAN THE INPUT ITEMS, DISREGARDING THE LETTERS BUT RETAINING THE ORDER OF ITEMS, BE PERMUTTED TO 7245683? (5 PTS)

D) IF LINES 14, 19-23 ARE REMOVED, WHAT WOULD THE DEVICE BE CALLED? (2.5 PTS)

E & F) WHEN THEY ARE REMOVED, WHAT ARE THE ANSWERS TO 1B AND 1C ABOVE? (4 PTS AND 5 PTS)

4) GIVEN TWO DISJOINT CIRCULAR LISTS, L1 AND L2 POINTED TO BY PTR1 AND PTR2 RESPECTIVELY, SHOW THE INSERTION OF L2 AT THE RIGHT OF L1. USE L1=A, B, C, D AND L2=E, F, G, H. BE SURE TO SHOW BOTH THE BEFORE AND AFTER DIAGRAMS, INCLUDING THE POINTERS. (10 PTS)

5) WHY IS THE SKY BLUE?
1) Given storage blocks of 3000, 2000, and 1000 units, respectively, would the best fit or first fit strategy allow the maximum allocations given requests of 1000, 2000, and 3000 units, respectively? Which is usually the best strategy according to Knuth?

A) __________________________ (1.5 pts)

B) __________________________ (1 pts)

2) Which of the following do not match?
   Sun: Heat
   Moon: Lunatic
   Girl: Emotion
   Place: Sentiment
   Mind: Haystack

3) Given the following code and data,
   DEVICE: PROC OPTIONS (MAIN);
   DCL ARP (10) CHAR (10);
   DCL (N, n) PAR CHAP (10);
   J=51;
   A: GET EDIT (OP) (A(1));

         K=K-1;
         GOTO A;
      END:
   GET EDIT (N) (A(1));
   IF OP='8' THEN
      DO:
         ARRAY(K)=N;
         K=K+1;
         END;
   ELSE
      DO:
         ARRAY(J)=N;
         J=J-1;
      END:
   GOTO A;
L99:
END DEVICE;

A1R2DA3A4B56CB7A8CDCCC
A) Give the formal name of the device it simulates, (2.5 pts.)

B) Give the output resulting from the input string given, assuming that A means insert at end X, B insert at Y, C delete at X, D delete at Y, (4 pts)
C) CAN THE INPUT ITEMS, DISREGARDING THE LETTERS BUT RETAINING THE ORDER OF ITEMS, BE REARRANGED TO 7245683? (5 PTS)

D) IF LINES 14, 19-23 ARE REMOVED, WHAT WOULD THE DEVICE BE CALLED? (2.5 PTS)

E & F) WHEN THEY ARE REMOVED, WHAT ARE THE ANSWERS TO 1B AND 1C ABOVE? (4 PTS AND 5 PTS)

4) GIVEN TWO DISJOINT CIRCULAR LISTS, L1 AND L2 POINTED TO BY PTR1 AND PTR2 RESPECTIVELY, SHOW THE INSERTION OF L2 AT THE RIGHT OF L1. LET L1=A,B,C,D AND L2=E,F,G,H. BE SURE TO SHOW BOTH THE BEFORE AND AFTER DIAGRAMS, INCLUDING THE POINTERS. (10 PTS)

5) WHY IS THE SKY BLUE?

ANS: BECAUSE IT IS NOT RED

PROCEDURE OPTIONS(MAIN):
/*
** THIS PROGRAM IS DESIGNED TO ACCEPT DATA ENTRIES WHICH CONSISTS
** OF SETS OF QUESTIONS AND ANSWERS, AND TO PROCESS THEM ACCORDING
** TO THE FORMAT AND SPACE CODES. THE PROCESSED INFORMATION IS
** STORED IN A REGIONAL(3) DIRECT DATASET. THE PROGRAM ALSO
** PROVIDES THE USER WITH A FORMATTED LISTING OF THE DATASET
** CREATED
**
** AN OPTION "NO TITLE" CAN BE PASSED TO THIS PROGRAM THROUGH
** THE PARM PARAMETER AND THIS TELLS THE PROGRAM THAT NO TITLE
** INFORMATION IS BEING PROVIDED BY THE USER. IF THIS OPTION IS NOT
** TURNED ON, THEN THE TITLE INFORMATION IS READ IN FIRST AND STORED
** IN A SPECIAL LOCATION WHICH IS DENOTED BY THE Key "INFO-IDGOC".
** OTHERWISE THE CHARACTER '*' IS PLACED IN THAT LOCATION.
** INDICATING NO TITLE INFORMATION
**
** THE PROCESSING OF THE DATA ENTRIES IS DONE BY A SUBROUTINE
** FORMAT WHICH RETURNS THE PROCESSED INFORMATION THROUGH THE
** ARGUMENT DATA. ARGUMENT DONE WHEN TURNED ON INDICATES END OF
** FILE
**
** A QUESTION NUMBER IS ASSIGNED TO EACH DATA ENTRY AND A REGION
** CORRESPONDING TO THAT DETERMINED. THE QUESTION NUMBER
** CONCATENATED WITH THE REGION FORMS THE KEY FOR THE RECORD.
** TO BE WRITTEN OUT ON DISK
**
** SUBROUTINE REPMID IS CALLED WITH VARYING TURNED ON AND THE OTHER
** ARGUMENT AS DUMMIES. THIS IS BECAUSE ONLY THE MASTERFILE PRINT
** OUT IS REQUIRED AND NOT THE OTHER PRINT OUTS.
**
** DEFINITION OF SOME VARIABLES
**
** QTY_QUEST: 00000 AND REGION ARE CHARACTER VARIABLES,
** QTY_QUEST IS USED FOR INCREMENTING QUES NO EACH TIME
** A DATA ENTRY IS READ IN AND ALSO TO DETERMATE THE
** REGION
** PDFY1, OFLY2: SINCE RECORD 127 DOES NOT PERMIT A VARYING
** STRING IN A STRUCTURE OF OFLY1 IS OVERLAID ON DATA
** AND THE NECESSARY INFORMATION MOVED TO THE STRING
** OFLY2, OFLY2 IS WRITTEN ON TO THE REGIONAL(31
** FILE)
**
** KEYSAVE: THE HIGHEST QUESTION NUMBER IS SAVED IN A SPECIAL
** LOCATION WITH THE KEY '000000000000' SO THAT WHILE
** UPDATING, IT CAN BE RETRIEVED AND USED FOR GENERATING
** QUESTION NUMBERS IN SEQUENCE
**

University of Madras, India, 1971

AN ABSTRACT OF A MASTER'S REPORT

submitted in partial fulfillment of the

requirements for the degree

MASTER OF SCIENCE

Department of Computer Science

KANSAS STATE UNIVERSITY

Manhattan, Kansas

1973
ABSTRACT

This work was undertaken with the objective to develop and implement an Exam Generation System which would facilitate automatic generation of course examinations, the questions appearing in the examination being retrieved from a previously created database. Three PL/1 programs have been developed to create and update the database and to obtain a formatted examination with answer space provided for each question. The programs have been established as cataloged procedures.
