A SURVEY OF PHYTOESTROGENIC ACTIVITY IN KANSAS FLINT HILLS PASTURES ¹

Summary

The botanical composition and basal cover of three Kansas Flint Hills pastures located in Butler and Chase counties was surveyed to estimate the incidence of plant species that contain appreciable levels of estrogenic activity. Many-flowered scurfpea and Ladino clover were the only plant species classified as high in estrogenic activity. Although significant estrogenic activity existed in specific species, the willingness of livestock to consume those species is unclear.

(Key Words: Flint Hills Pastures, Phytoestrogen, Buller Steer Syndrome.)

Introduction

Incidence of the buller steer syndrome in feedlots is typically less than 4%, but can occasionally reach 10%. However, several Kansas feedlot managers have observed individual pen bulling rates as high as 30% in steers previously grazed on Kansas Flint Hills native pastures. Factors such as social hierarchy, aggressive behavior, seasonality, entry weights, stress, pheromones, and growth promoting implants have been suggested as factors contributing to the occurrence of the buller steer syndrome. More recently, plant estrogens have been impli-

cated as an additional factor that might increase bulling activity or reduce the efficacy of growth-promoting implants.

More than 40 plant species have been shown to contain estrogenic activity. Estrogenic activity is widespread among many legumes, including subterranean (Trifolium subterran), white (Trifolium repens), and red (Trifolium pratense) clovers, as well as alfalfa. Many leguminous plants, such as purple prairieclover, Illinois bundleflower, catsclaw sensitive briar, showy partridgepea, and many-flowered scurfpea, naturally inhabit Flint Hills native-grass pastures. Moreover, introduced species such as Korean lespedeza, which was extensively air-seeded during the 1950's, may be present (Owensby, personal communication, 1999). However, it is not known if plant species found in Flint Hills pastures contain estrogenic activity in appreciable concentrations or if they are consumed in sufficient quantities to elicit bulling activity. Consequently, during July we determined the phytoestrogenic activity in a variety of pasture plants, as well as in alfalfa collected at a commercial feedlot.

Experimental Procedures

Botanical composition and basal cover estimates from three pastures in the Flint Hills were determined in July, 1999, using a

modification of the step-point system outlined by Owensby (1973). Individual plant species were collected over three sampling periods during the latter stages of intensive-early grazing (early to mid-July). All forage samples were frozen and shipped overnight to a University of Missouri laboratory for phytoestrogen analyses.

The bioassay (Welshons et al., 1990; J. Vet Diagn Invest. 2:268) measures estrogenstimulated growth of MCF-7 cells in tissue culture. It is both specific in that it detects only estrogens and inclusive, detecting all estrogenic compounds. The assay is exceptionally sensitive, requires minimal sample preparation, and allows a large number of feed/forage samples to be screened.

Results and Discussion

Table 1 illustrates the plant species composition of the three Flint Hills pastures. Major warm season perennial grass such as big bluestem, little bluestem, indiangrass and switchgrass, represented about 70% of the the plant species counted in pastures A and B, with leguminous plants and forbs repre-

senting 7 to 12%. Pasture C contained more cool season grasses, forbs and sedges.

Estrogenic activity varied dramatically among the species assayed. Table 2 shows the results of the bioassay expressed in zearalenone equivalents, which is the amount of zearlenone required to give the observed response. The highest estrogenic activity was found in Ladino clover and many-flowered scurfpea (Psoralea tenuiflora Pursh). Intermediate levels of activity were found in alfalfa, black medic, and Korean lespedeza. Because Korean lespedeza is an introduced species, its presence is variable and depends upon the original seeding. Low levels of activity were found in roundhead lespedeza, wood sorrel, and yellow sweet clover. Only traces of activity were found in the grasses.

Native and introduced legumes comprised only 3 to 4% of the plant species in the three pastures we studied. This raises questions regarding their potential contribution to the buller steer syndrome. Collecting samples throughout the grazing season and measuring actual plant selection by animals will answer that question.

Table 1. Plant Species Composition of Three Flint Hills Pastures (1999)

| | Pasture | | | |
|--------------------------------|--------------------|--------|--------|--|
| | A | В | С | |
| | Count (Percentage) | | | |
| Major warm season ^a | 72.24% | 70.27% | 58.74% | |
| Minor warm season ^b | 12.07% | 12.41% | 10.72% | |
| Cool season ^c | 2.24% | 0.86% | 7.15% | |
| Misc. grass ^d | 2.41% | 0.86% | 1.94% | |
| Forbs ^e | 3.28% | 5.78% | 8.39% | |
| Native Legume ^f | 4.14% | 2.99% | 3.26% | |
| Sedge | 3.62% | 6.84% | 9.79% | |
| Total | 100% | 100% | 100% | |

^aBig blue, little blue, indian, switch. ^bBuffalo, grama, sideoats. ^cAnnual, fescue, Brome, Poa. ^dPanic, dropseed. ^eAnnual, field pussytoe, ragweed, aster, oxalis, yarrow, Goldenrod, daisy fleabane, milkweed, dandelion, many-flowered scurfpea, wood sorrel, western yarrow, western ragweed, showy partridge pea, purple prairie coneflower, Illinois bundleflower, catsclaw sensitive briar, California loosestrife. ^fBlack medic, Korean lespedeza, iron weed, leadplant, ladino clover, roundhead lespedeza.

Table 2. Zearalenone equivalent of Kansas Flint Hills Native Plant Species

| | Zearalenone Equivalent, ppm dry basis | | | |
|--------------------------|---------------------------------------|---------------------|---------|------------------|
| Plant Species | No. of Samples | Ranges ^a | Average | Range |
| Ladino clover | 5 | high | 10.9624 | 2.032 - 36.239 |
| Many-flowered scurfpea | 2 | high | 43.6929 | 39.39 - 47.9958 |
| Alfalfa hay | 6 | medium | 7.5120 | 3.103 - 13.051 |
| Black medic | 9 | medium | 5.0318 | 1.037 - 15.429 |
| Korean lespedeza | 13 | medium | 8.4032 | 0.8063 - 27.558 |
| Blue wild indigo | 1 | low | 3.2650 | 3.265 |
| Roundhead lespedeza | 3 | low | 1.2004 | 0.4266 - 2.355 |
| Wood sorrel (oxalis) | 1 | low | 1.9690 | 1.969 |
| Yellow sweet clover | 1 | low | 1.0140 | 1.014 |
| California loosestrife | 1 | < 1 ppm | 0.0412 | 0.0412 |
| Catsclaw sensitive briar | 9 | < 1 ppm | 0.0513 | 0.0133 - 0.145 |
| Grazed grass | 8 | < 1 ppm | 0.1063 | 0.0274 - 0.2602 |
| Illinois bundleflower | 3 | < 1 ppm | 0.2454 | 0.225 - 0.7363 |
| Leadplant | 11 | < 1 ppm | 0.2766 | 0.0831 - 0.595 |
| Non-grazed grass | 2 | < 1 ppm | 0.0186 | 0.0212 - 0.01602 |
| Purple prairie clover | 4 | < 1 ppm | 0.0771 | 0.0311 - 0.121 |
| Sedge | 1 | < 1 ppm | 0.1780 | 0.178 |
| Showy partridge pea | 1 | < 1 ppm | 0.7039 | 0.7309 |
| Ungrazed grass | 2 | < 1 ppm | 0.0120 | 0.01089 - 0.0131 |
| Western ragweed | 3 | < 1 ppm | 0.7760 | 0.293 - 1.041 |
| Western yarrow | 3 | < 1 ppm | 0.1077 | 0.0596 - 0.174 |
