# 2006 GRAIN SORGHUM CROP REVIEW

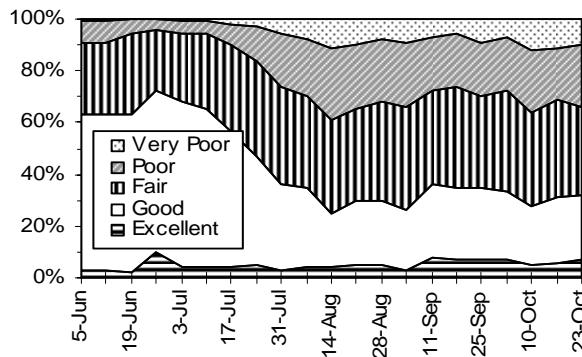

## Statewide Growing Conditions

The 2006 growing season continued the dry conditions of the previous year, with an extended period of high temperatures and minimal rain from May to late August (Figure 1). Badly needed rains and cooler temperatures in August and September replenished some topsoil moisture across the state; as of October, however, 48% of the state reported to be short or very short of topsoil moisture. Late-August rains arrived in time to benefit grain filling in eastern Kansas and flowering in western Kansas or for later plantings, but rain and cold temperatures in October delayed maturation and harvest in some instances.

**Figure 1. Statewide status of topsoil moisture.**

Crop condition declined from early July until late August (Figure 2). In late June, 72% of the grain sorghum crop was rated as good or excellent. By August 20, that percentage had dropped to 30%. Crop condition increased slightly in early September but declined so that only 35% was rated as good or excellent as harvest got under way.

**Figure 2. Condition of 2006 Kansas sorghum crop.**

Planting and emergence of grain sorghum progressed ahead of the 2005 and 5-year average until late May, when dry conditions delayed activities until mid June. Despite the planting delays, heading progressed at the average pace until hot, dry weather slowed plant maturation. The grain sorghum received much-needed assistance with rains in late August and cooler temperatures in September, but that relief came too late for much of the state. In late October, harvest was thirteen points behind last year and the 5-year average.

(Crop-Weather Reports, Kansas Agricultural Statistics, Topeka)

## Diseases

The 2006 cropping year was a mixed bag with regard to diseases in the grain sorghum crop. The good news was that, because of the dry weather up through the middle of August, there were few foliar disease problems and few problems from "wet weather" pathogens such as crazy top downy mildew. Once the rains began falling in mid-August, there was some late build-up of sooty stripe and northern corn leaf blight, mostly in fields with continuous high residue, but effects on yield should have been minimal in most fields.

The bad news was that the stalk rots, which are favored by dry, stressful conditions, were very bad in many parts of the state. Both Fusarium and charcoal rot stalk rot could be readily found in many areas of the state. Significant lodging was observed in some fields.

Fields that could not be harvested in a timely manner, due to rain, had the potential to develop grain mold problems. In general, the cream or lighter colored sorghums are more susceptible to this problem than the red and bronze colored sorghums. Moldy sorghum can be blended down with higher-quality grain or possibly used for ethanol production.

(Doug Jardine, Kansas State University Department of Plant Pathology)

## Insects

Very few early-season insect problems were noted throughout the state in 2006. Sugarcane rootstock weevils caused some concern in seedling plants, but infestations were not damaging enough to cause stand reductions because plants recovered after receiving timely precipitation. Chinch bugs were more evident than in 2005, but didn't cause widespread damage. Chinch bug populations did, however, increase throughout the summer, and were noticeable even after harvest. Adults and nymphs were observed feeding on wheat planted in milo stubble. This indicates that growers should be vigilant when planting sorghum in 2007 because the potential for over-wintering populations is substantial. Late-season infestations of "sorghum headworms" continued to be a problem, especially in fields planted later. This pest complex consisted of armyworms, fall armyworms, and corn earworms, and will probably continue in future years with late-planted and double-cropped sorghum.

(Jeff Whitworth, Kansas State University Department of Entomology)

## Harvest Statistics

The Kansas Agricultural Statistics Office predicted a 144.0-million-bushel crop in their October 12 Crops Report, down 26% from last year (Figure 3). The number of acres harvested was down 200,000 acres from last year, at 2.4 million. The average yield estimate of 60 bushels per acre was 15 bushels less than the final estimate for 2005.

(Kansas Agricultural Statistics)

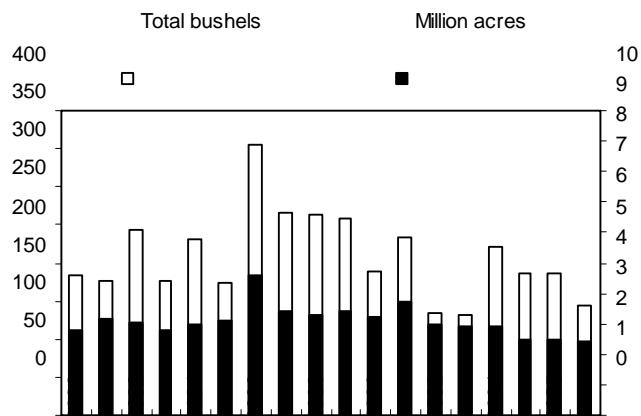

Figure 3. Historical Kansas grain sorghum production.

## 2006 PERFORMANCE TESTS

### Objectives and Procedures

Grain Sorghum Performance Tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and seed-industry personnel with unbiased agronomic information on many of the grain sorghum hybrids marketed in the state. Entry fees from private seed companies help finance the tests. Seed companies receive test announcements and entry forms in late January each year; deadlines for receipt of completed entry forms and seed are in mid-March. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown at all test locations.

A summary of growing-season weather data is given in individual test discussions. These data are from the nearest weather-reporting station and often are supplemented with information from the test site. Precipitation graphs include cumulative lines for 2006 and the 30-year normal, in addition to the daily rainfall amounts since last fall. Temperature graphs include daily maximum and minimum temperatures compared with normal. General trends in precipitation and temperature relative to normal are readily observed in the graphs. A table with monthly totals and averages for the growing season also is included.

The growth unit or growing-degree-day concept was developed to measure the amount of heat available for growth and maturation. To calculate the daily growing-degree-day accumulation, add the maximum temperature and the minimum temperature for each day, divide by 2, and subtract a base temperature of 35°F. Any temperature below 35°F was considered to be 35°F.

Explanatory information precedes data summaries for each test. Tables 2 through 23 contain results from the individual performance tests. Hybrids are listed in order of increasing days to half bloom and increasing grain moisture for the current year, so hybrids of similar maturity appear together.

Figures 4 through 8 graphically summarize yield and maturity information over the past 3 years for each region. In these figures, hybrid performance is standardized by using the average of two check hybrids present in every test. The number beside each bar shows the number of tests in which a given hybrid was compared with the check hybrids. In general, the greater the number of comparisons, the greater confidence one can place in the stated performance of that hybrid. Symbols beside each bar indicate if performance of a hybrid was significantly greater (+) or lower (-) than the average performance of the check hybrids. As with individual test results, small differences should not be overemphasized. Relative ranking and large differences are better indicators of performance.

Most tests were planted at a rate 25% to 30% greater than the desired population and thinned only to remove doubles. Planting to stand enables evaluation of product performance for the entire growing season.

Three or four plots (replications) of each hybrid were grown in a randomized complete-block design at each location. Each harvested plot consisted of two rows trimmed to a specific length ranging from 20 to 30 feet at the different locations. Tests were harvested with specialized plot combines equipped with automatic weighing and sampling devices.

Grain yields are reported as bushels per acre of shelled grain (56 lbs/bu) adjusted to a moisture content of 12.5%. Yields also are presented as a percentage of test average to speed recognition of highest-yielding hybrids. Hybrids yielding more than 100% of the test average year after year merit consideration. Adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

The percentage of lodged stalks is reported when appropriate. Both broken stalks and stalks leaning more than 45 degrees from vertical were considered lodged, although most were harvestable with modern machinery. Severely lodged stalks or dropped heads that could not be picked up by normal harvest procedures were not included in yield. Because harvest often is delayed until latest maturing entries are ripe, early and mid-season hybrids

could lodge simply because they must wait well past their optimum harvest date.

Relative maturity is measured in terms of both number of days from planting to half bloom and grain moisture at harvest. Maturity can be critical when considering a sorghum hybrid for a specific cropping system.

Small differences in yield or other characteristics should not be overemphasized. Least significant differences (LSD) are shown at the bottom of each table. Unless two entries differ by at least the LSD shown, little confidence can be placed in one being superior to the other.

The coefficient of variability (CV) can be used to estimate the degree of confidence one can have in published data from replicated tests. In this testing program, a CV of less than 10% generally indicates reliable, uniform data, whereas a CV of 10 to 15% is not uncommon and usually indicates that data are acceptable for the rough performance comparisons desired from these tests. Tests with a CV greater than 15% still may be useful, especially in situations with low yields.

## SOUTHEAST KANSAS GRAIN SORGHUM TEST ON SILT LOAM SOIL

East Central Kansas Experiment Field, Ottawa; Larry Maddux, agronomist; Jim Kimball, technician

Woodson silt loam; Soybean in 2005

96 - 24 - 12 lb/a N, P, K

Planted on 5/16/2006; Harvested on 9/29/2006

Target stand of 55,000 plants/acre; 3.8 in. spacing

All hybrids experienced some degree of lodging, sometimes extensive.

## SOUTHEAST KANSAS GRAIN SORGHUM TEST ON SILTY CLAY SOIL

ImMasche Research Center, Strong City; Kraig Roozeboom, agronomist; Gene Eidman, cooperator

Osage silty clay; Soybean in 2005

130 - 35 - 0 lb/a N, P, K

Planted on 5/16/2006; Harvested on 10/4/2006

Target stand of 55,000 plants/acre; 3.8 in. spacing

Uneven emergence due to wet conditions at planting. Applied 35-35-0 2' to side of row at planting.

## SOUTHEAST KANSAS GRAIN SORGHUM TEST ON SILT LOAM SOIL

Southeast Agricultural Research Center, Parsons; James Long, agronomist; Kelly Kusel, technician

Parsons silt loam; Soybean in 2005

93 - 60 - 100 lb/a N, P, K

Planted on 5/17/2006; Harvested on 8/22/2006

Target stand of 45,000 plants/acre; 4.6 in. spacing

Lodging just before harvest due to Fusarium and charcoal rot. Excellent stand and emergence because of rains the week before planting.

## CENTRAL KANSAS DRYLAND GRAIN SORGHUM TEST ON SANDY LOAM SOIL

Clayton Short farm; Kraig Roozeboom, agronomist

Hord silt loam; Soybean in 2005

90 - 35 - 0 lb/a N, P, K

Planted on 5/22/2006; Harvested on 10/5/2006

Target stand of 50,000 plants/acre; 4.2 in. spacing

Good early growth. Very hot and dry from June through July, and did not receive much of the beneficial rain in August.

## CENTRAL KANSAS GRAIN SORGHUM TEST ON SILTY CLAY LOAM SOIL

Harvey County Experiment Field, Hesston; Mark Claassen, agronomist; Lowell Stucky and Kevin Duerksen, technicians

Ladysmith silty clay loam; Soybean in 2005

90 - 37 - 0 lb/a N, P, K

Planted on 6/8/2006; Harvested on 10/20/2006

Target stand of 35,000 plants/acre; 6.0 in. spacing

June, July, and August had extended periods of extreme heat and below-normal rainfall. Moderate temperatures and rainfall in late August greatly benefited the crop. There were a few cases of neck rot observed. Despite mid-season stress, yields were very good.

## WEST KANSAS GRAIN SORGHUM TEST ON SILT LOAM SOIL

Agricultural Research Center, Hays; Kenneth Kofoid, agronomist

Harney silt loam; Soybean in 2005

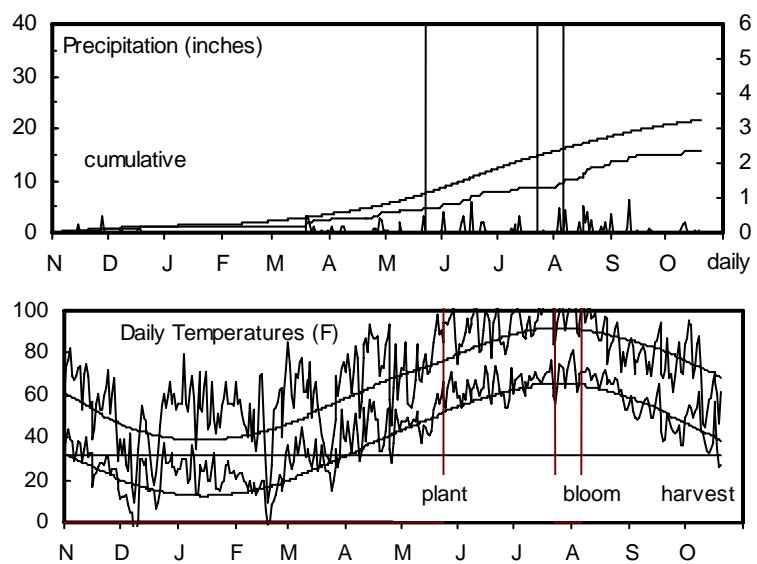

60 - 0 - 0 lb/a N, P, K

Planted on 5/24/2006; Harvested on 11/9/2006

Target stand of 35,000 plants/acre; 6.0 in. spacing

Growing season was very hot and fairly dry. Subsoil moisture was poor all season long. Flowering was erratic. Rains in August caused profuse tillering, but tillers were not very productive.

## WEST KANSAS FALLOW GRAIN SORGHUM TEST ON SILT LOAM SOIL

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Fallow in 2005

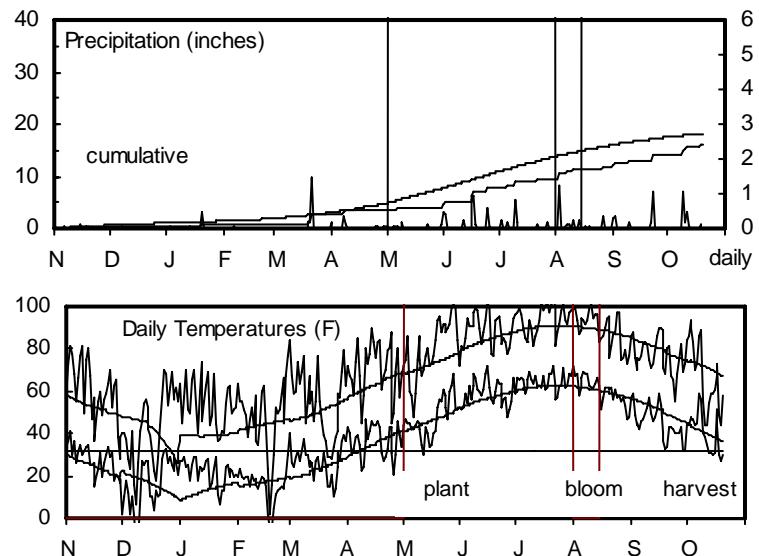

60 - 0 - 0 lb/a N, P, K

Planted on 5/2/2006; Harvested on 10/25/2006

Target stand of 25,000 plants/acre; 8.4 in. spacing

Crusting after a heavy rain caused stand reductions. Growing-season temperatures and rainfall were near normal.

## WEST KANSAS FALLOW GRAIN SORGHUM TEST ON SILT LOAM SOIL

Southwest Research-Extension Center, Tribune; Alan Schlegel, agronomist

Ulysses silt loam; Fallow in 2005

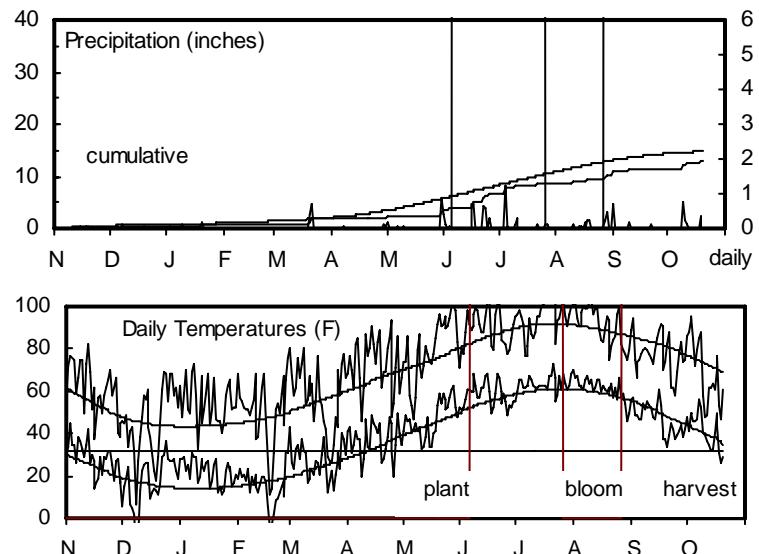

108 - 27 - 0 lb/a N, P, K

Planted on 6/6/2006; Harvested on 10/22/2006

Target stand of 25,000 plants/acre; 8.4 in. spacing

Good moisture and emergence at planting. Drier than normal the rest of the spring and summer.

## WEST KANSAS FALLOW GRAIN SORGHUM TEST ON SILT LOAM SOIL

Southwest Research-Extension Center, Garden City; Monty Spangler, technician

Keith silt loam; Fallow in 2005

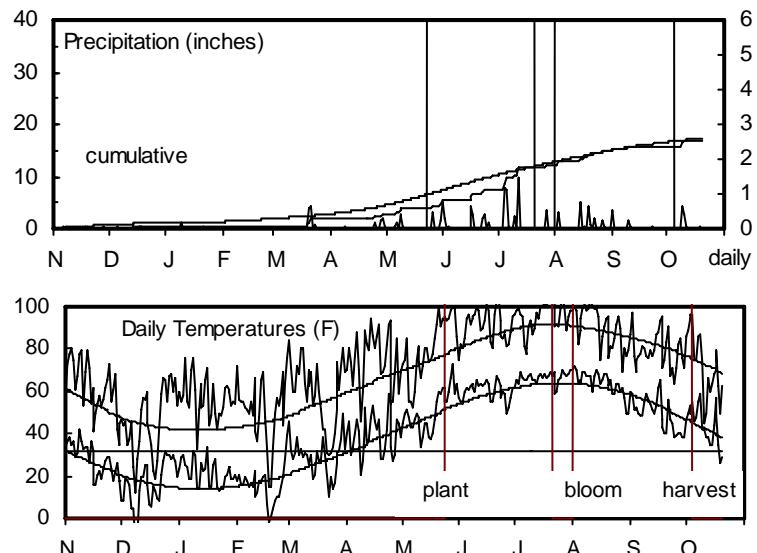

100 - 0 - 0 lb/a N, P, K

Planted on 5/24/2006; Harvested on 10/3/2006

Target stand of 35,000 plants/acre; 6.0 in. spacing

Hot, dry conditions in July and early August caused stress-related lodging in most entries.

## NORTH CENTRAL KANSAS IRRIGATED GRAIN SORGHUM TEST ON SILT LOAM SOIL

Irrigation Experiment Field, Scandia; Barney Gordon, agronomist; Michael Larson and Allan Milner, technicians

Crete silt loam; Soybean in 2005

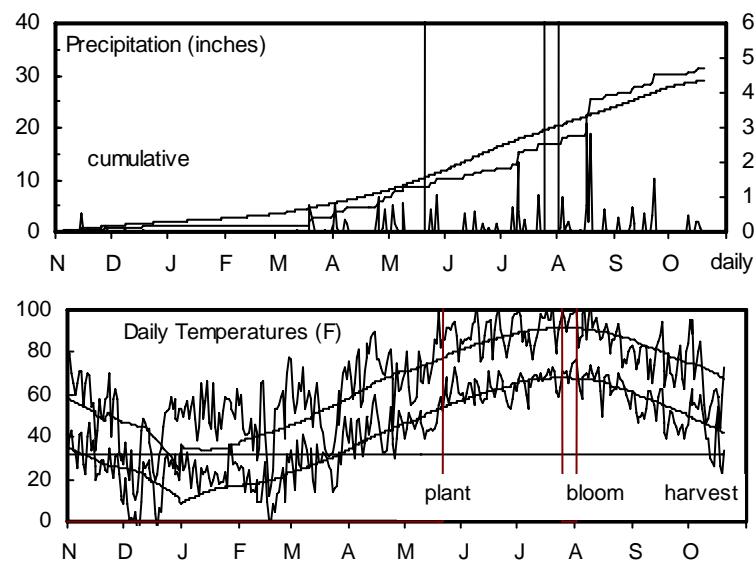

200 - 30 - 0 lb/a N, P, K

Planted on 5/22/2006; Harvested on 10/31/2006

Target stand of 82,200 plants/acre; 2.5 in. spacing

Good emergence and early growth; very hot and dry from June through July. Still hot in August, but good rainfall.

## SOUTH CENTRAL KANSAS IRRIGATED GRAIN SORGHUM TEST ON SILT LOAM SOIL

South Central Kansas Experiment Field, Hutchinson; William Heer, agronomist; John Evans, cooperator

Ost loam; Wheat in 2005

175 - 30 - 0 lb/a N, P, K

Planted on 6/9/2006; Harvested on 10/22/2006

Target stand of 90,000 plants/acre; 2.3 in. spacing

Frequent rains delayed planting. Cool, wet conditions existed through June. There was some bird feeding damage to the plots.

## WEST KANSAS IRRIGATED GRAIN SORGHUM TEST ON SILT LOAM SOIL

Northwest Research-Extension Center, Colby; Patrick Evans, agronomist

Keith silt loam; Sunflower in 2005

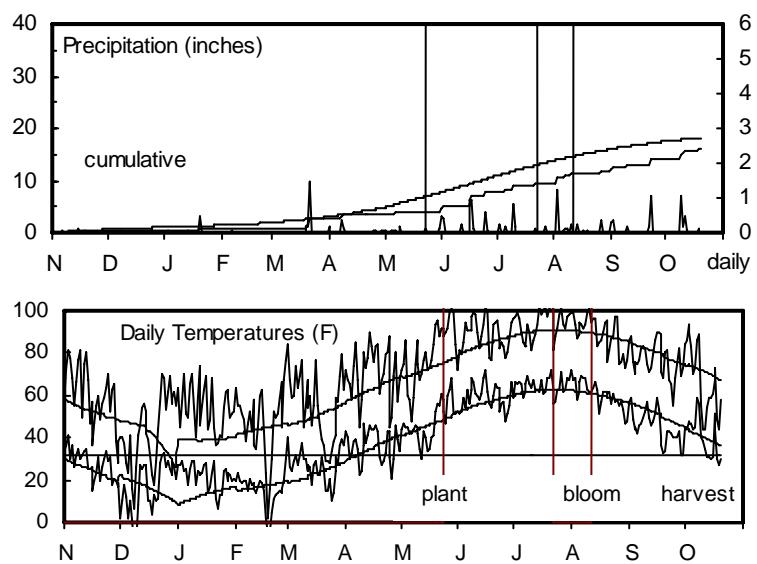

140 - 45 - 0 lb/a N, P, K

Planted on 5/24/2006; Harvested on 11/1/2006

Target stand of 90,000 plants/acre; 2.3 in. spacing

Heavy rains after planting caused crusting and reduced stands. The growing season was normal, with good growing conditions.

## WEST KANSAS IRRIGATED GRAIN SORGHUM TEST ON SILT LOAM SOIL

Southwest Research-Extension Center, Garden City; Monty Spangler, technician

Keith silt loam; Fallow in 2005

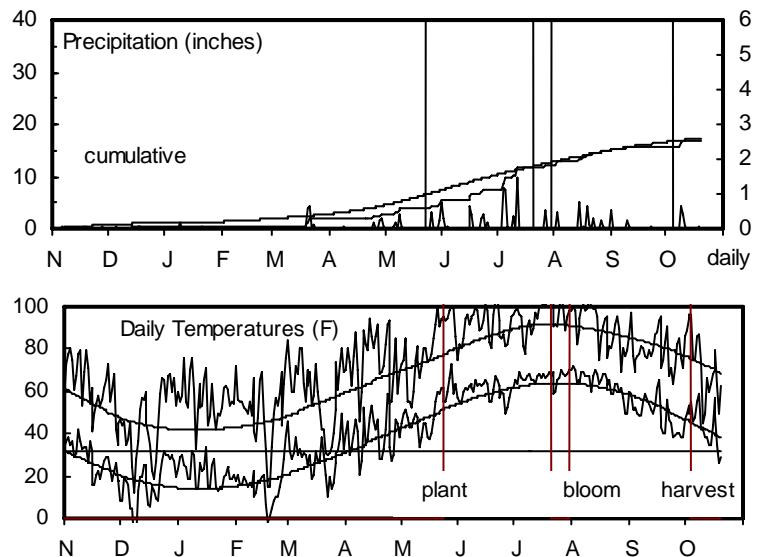

100 - 0 - 0 lb/a N, P, K

Planted on 5/24/2006; Harvested on 10/3/2006

Target stand of 70,000 plants/acre; 3.0 in. spacing

Rains before planting and good moisture through emergence helped early growth. No lodging, diseases, or insect pressures reported.

Excerpts from the  
University Research Policy Agreement with Cooperating Seed Companies \*

Permission is hereby given to Kansas State University to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 969, '2006 Kansas Performance Tests with Grain Sorghum Hybrids,' or the Kansas Crop Performance Test Web site, <http://kscroptests.agron.ksu.edu>, for details. Endorsement or recommendation by Kansas State University is not implied."
