Alfalfa is a major irrigated cash crop in Western Kansas. Sizable cattle feeding and expanding dairy operations in the area provide a ready market for alfalfa hay. Additionally, producers and hay brokers routinely ship alfalfa hay and pellets produced in the area out of Kansas. Under good management, alfalfa can be as profitable as corn or other irrigated grain crops.

Multi-peril crop insurance is not available for this crop in this area. Land values have been adjusted for alternative yield goals in this budget. In customizing this budget to fit your farm, attention should be given to using land values representative of your farm's productive capacity. Projections of net percentage return on investment permit comparisons to be made among alternative enterprises and other investments.

Cost-Return Projections

Land preparation costs are included in land value. Other investments are shown in Table 1. Price of the energy source and total dynamic head are the important factors affecting pumping costs. For instance, a \$1 change in natural gas price causes a \$2.97 increase with 100 feet TDH. However, with 500 feet TDH, a \$1 change in gas price causes a \$14.83 change in costs for each acre foot of water pumped.

The choice of a flood or center pivot system depends on: (1) available capital; (2) labor availability during the growing season; (3) the terrain, which may require a center pivot system; and (4) soil type. Capital outlays will be \$20,000 to \$40,000 higher with a center pivot system, but labor requirements could be reduced by as much as 1 hour per acre compared to flood irrigation. MF-836, *Irrigation Capital Requirements and Energy Costs*, shows the irrigation costs and energy input amounts used in this budget.

Yield Goals, Return Factors

Cost per ton and net returns in crop production are highly dependent on yields. The following estimated budget includes three different yield levels. Yield goals vary for a number of reasons such as soil type/land quality, historical weather patterns, input levels, and management. Budgeting for alternative yield goals can help producers compare the profitability of crop enterprises on farmland tracts with varying yield potentials.

Table 1. Factors Used for Cost-Return Budget

Item	Yield Level (ton)			
	3.5	5.0	6.5	
Water, 325 TDH	14	19	24	\$1.95/inch
