2000 KANSAS CORN PERFORMANCE TESTS

INTRODUCTION

TEST OBJECTIVES AND PROCEDURES

Corn Performance Tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and private research and sales personnel with unbiased agronomic information on many of the corn hybrids marketed in the state. Entry fees from private seed companies help finance the tests. Seed companies receive test announcements and entry forms in late January each year; deadlines for receipt of completed entry forms and seed are in early March. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown uniformly at all test locations.

Short-season corn performance tests are similar to the full-season tests, except where noted. This series of tests targets evaluation of corn hybrids for use in early-planted, short-season, cropping systems. Hybrids with adequate heat and drought tolerance are needed for these systems. These hybrids often will be subjected to severe heat and drought stress in July and August. These systems typically are utilized on soils with poor water-holding capacities. Early-maturing hybrids often are able to escape a good portion of the typical stress, if they can be planted early. Utilization of short-season hybrids under irrigation often is related to the desire to reduce irrigation inputs or to facilitate specific crop rotations.

A summary of growing-season weather data is given in individual test discussions. These data are from the nearest weather-reporting station and often are supplemented with information from the test site. Precipitation graphs include cumulative lines for 2000 and the 30-year normal in addition to the daily rainfall amounts since last fall. Temperature graphs include daily maximum and minimum temperatures compared with normal. Growing degree graphs include cumulative lines for 2000 and normal. All graphs include vertical lines indicating planting, silking, and harvest dates, if available. General trends in

precipitation and temperature relative to normal are readily observed in the graphs. For more detailed information, a table is included with monthly totals and averages for the growing season.

CORN BORER status of a representative susceptible hybrid is listed with the other descriptive information preceding each table for several locations. The listed infestation rates and tunnel lengths may not represent the actual extent of damage if the sampling date precedes harvest by several weeks, but they do provide an indication of the level of corn borer infestation at a given location. Early harvest prevented sampling at many locations.

Explanatory information is given preceding data summaries for each test. Tables 1-24 contain results from the individual performance tests. Hybrids are listed in order of increasing days to half silk and increasing grain moisture for the current year, so hybrids of similar maturity appear together. Yield summaries following each group of tests (Tables 4, 8, 13, 18, 22, 25) present yield as a percent of the average for each location and averaged over all locations in that region. The 2000 entrants and entries are listed in the Appendixes.

Figures 5-10 graphically summarize yield and maturity information over the past 3 years for each region. In these figures, hybrid performance is standardized using the average of two check hybrids present in every test (Pioneer 3162 and Golden Harvest H2530). The number beside each bar shows the number of tests where a given hybrid was compared with the check hybrids. In general, the greater the number of comparisons, the greater confidence one can place in the stated performance of that hybrid. Symbols beside each bar indicate if a hybrid was significantly greater (+), lower (-), or not different (no symbol) than the average of the check hybrids. As with individual test results, small differences should not be overemphasized. Rather relative ranking and large differences are better indicators of hybrid performance.

Most corn tests were planted at a rate 10% to 20% above the desired population and thinned only to remove doubles. Planting to stand enables evaluation of product performance for the entire growing season.

Tractor-powered, modified, White air-planters were used for nearly all tests. Four plots (replications) of each hybrid were grown at each location in a randomized complete block design. Four-row plots were used in the west no-till tests. Each harvested plot consisted of two rows trimmed to a specific length ranging from 20 to 30 feet at the different locations. Tests were harvested with specialized plot combines equipped with automatic weighing and sampling devices.

GRAIN YIELDS are reported as bushels per acre of shelled grain (56 lbs/bu) adjusted to a moisture content of 15.5%. *BUSHEL YIELDS* are given but also are converted to *YIELDS AS PERCENTAGES OF THE TEST AVERAGE* to speed recognition of highest-yielding hybrids (more than 100%, the test average). The actual test average in bushels per acre is listed as the test average in the *YIELD AS % OF TEST AVERAGE* columns as a guide to actual yields. Hybrids yielding more than 100% of the test average year after year merit consideration, but adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

The number of *LODGED EARS* is reported, when appropriate. Plants broken over below the ear and dropped ears were considered *LODGED*, although many were harvestable with modern machinery. Severely lodged stalks or dropped ears that could not be picked up by normal harvest procedures were not included in yield. Because harvest often is delayed until latest maturing entries are ripe, early and mid-season hybrids could lose ears simply because they must wait well past their optimum harvest date. In most years at most locations, dropped ears constitute a very small portion of lodging and do not significantly affect yields.

Relative maturity is measured in terms of both *NUMBER OF DAYS FROM PLANTING TO SILKING* and *GRAIN MOISTURE AT HARVEST* at most locations. Entries are listed in order of increasing maturity based on days to silking and

harvest moisture in the current year to facilitate comparison of hybrids of like maturity. Maturity can be critical when considering a corn hybrid for a specific cropping system.

The *GROWTH UNIT* or *GROWING DEGREE DAY* concept was developed to measure the amount of heat available for growth and maturation. The formula used to generate the monthly totals in individual test discussions follows. Take the maximum temperature plus the minimum temperature for each day, divide by 2, and then subtract a base temperature of 50 each day. Any temperature below 50°F was considered to be 50, and any temperature over 86°F was called 86. Growth unit accumulations for the current year are compared with the long-term average or 'normal' for each test.

Small differences in yield or other characteristics should not be overemphasized. Least significant differences (LSD's) are shown at the bottom of each table. Unless two entries differ by at least the LSD shown, little confidence can be placed in one being superior to the other. The coefficient of variability (CV) can be used to estimate the degree of confidence one can have in published data from replicated tests. In this testing program, CV's below 10% generally indicate reliable, uniform data, whereas CV's of 10 to 15% are not uncommon and usually indicate that data are acceptable for the rough performance comparisons desired from these tests. Tests with CV's over 15% still may be useful, but hybrid comparisons lack precision.

2000 STATEWIDE GROWING CONDITIONS

Temperature (Figure 1) and precipitation as reflected in topsoil moisture status (Figure 2) should be considered together when examining their affect on the condition (Figure 3) and development (Figure 4) of the 2000 corn crop. Relatively warm, dry conditions early in the season prompted early planting in many parts of the state. Roughly 75% of the crop was in the ground by May 1, 2 weeks ahead of the 5-year average. Most of the state had adequate soil moisture at planting, but some areas were already dry at that time. Topsoil moisture generally declined from early April until harvest. Heavy rainfall in late July provided much-needed moisture in southern Kansas, but northern areas received little relief. High temperatures near or

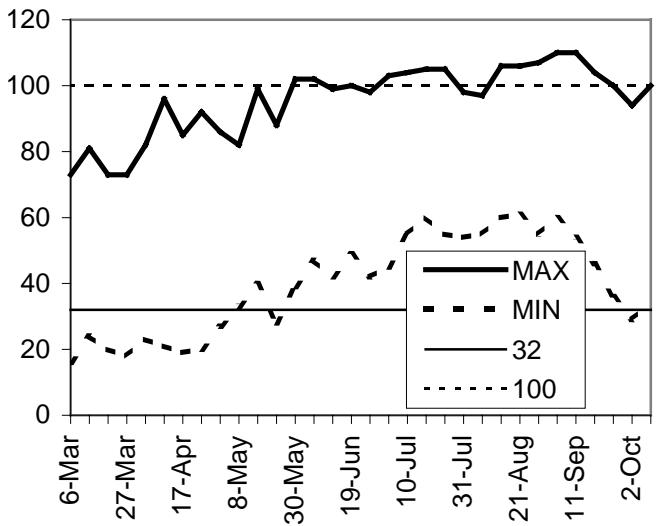

Figure 1. 2000 Kansas weekly maximum and minimum temperatures.

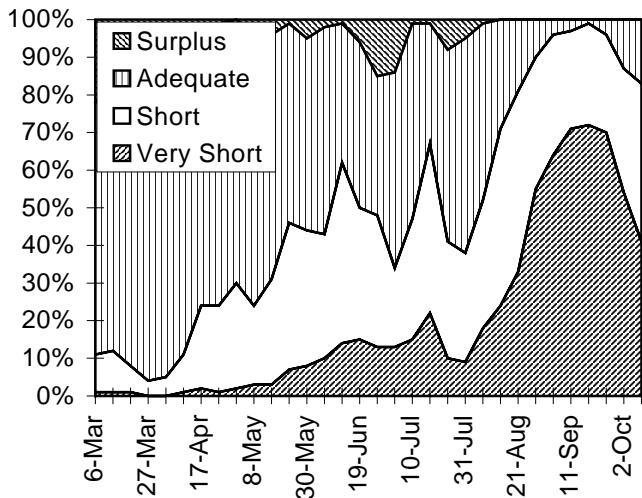

Figure 2. Statewide status of topsoil moisture.

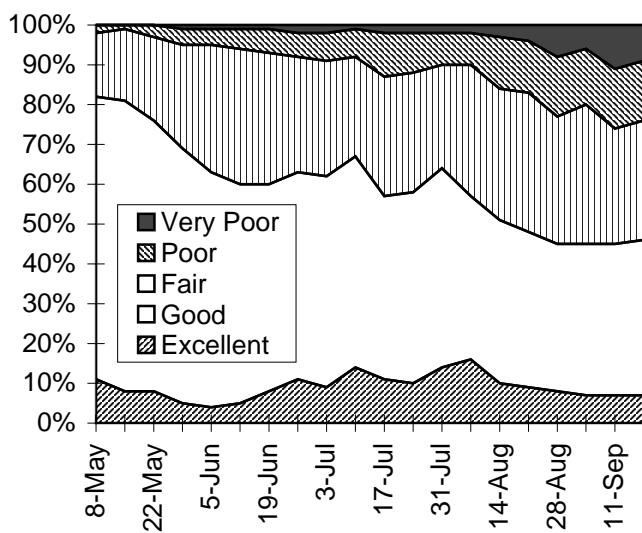

Figure 3. Condition of 2000 Kansas corn crop.

above 100° F prevailed from early June through harvest. The high temperatures coupled with the ongoing decline in soil moisture during this same time period caused the condition of the crop to decline accordingly. By late August, over half the crop was characterized as fair, poor, or very poor.

The early planting caused the corn crop to reach silking about a week and a half ahead of average. The crop reached the dent stage roughly 1 week early. The dry, hot conditions in August accelerated maturation and dry-down. As a result, harvest progressed well ahead of average and was over 85% complete by October 1.

(From Crop-Weather reports, Kansas Agricultural Statistics, Topeka).

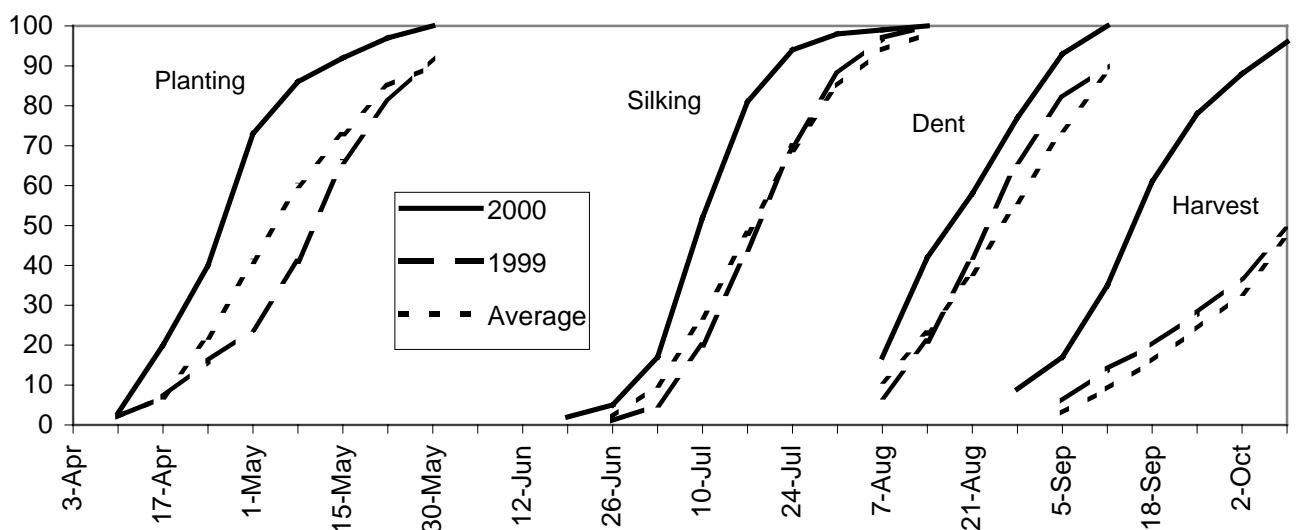

Figure 4. Progress of 2000 Kansas corn crop.

A number of insect pests appeared in corn fields across the state in 2000. Flea beetles damaged some fields in May. Typically, corn can grow out of this damage, but several producers applied insecticide. Southern corn billbug severely damaged a 20-acre field in Finney County in June.

Both southwestern and European corn borers began laying eggs in mid-June. By mid-late June, southwestern corn borers were appearing as far north as the Nebraska border. Unusually high levels of southwestern corn borer in north central Kansas likely resulted from the mild temperatures experienced last winter. High levels of this pest also were found in south central and southwestern Kansas corn fields, contributing to substantial lodging if not adequately controlled.

Spider mites were noted in some fields. However, populations didn't develop as much as might be expected with the dry weather.

(From Kansas Insect Newsletter, Extension Entomology, Kansas State University and Kansas Cooperative Economic Insect Survey Reports, Kansas Department of Agriculture.)

The below-average rainfall throughout the season in most areas of the state resulted in less disease pressure than in recent years. Some corn planted very early in the season suffered from a physiological problem known as cold weather crown injury. Heavy flea beetle pressure resulted in significant levels of Stewart's bacterial wilt in

some fields. In the most severe cases, plants were killed and stands were thinned. Other than Stewart's wilt, few seedling blight problems were reported from around the state. Because of the lack of rainfall, few foliar disease problems were reported.

Although the dry weather limited seedling and foliar disease problems, it favored the development of both fusarium stalk rot and charcoal rot. Anthracnose stalk rot also was found in a few fields. Some fields were near 100% infected. Yield loss varied from field to field and was dependent on how early the disease developed and the susceptibility of the hybrid.

Ear rot pressure was generally low, but some problems were reported from southwestern Kansas, particularly on double-cropped corn. Low humidity in August resulted in few problems from *Aspergillus flavus*, the producer of aflatoxin, but significant levels of *Fusarium* developed in some fields.

(From Doug Jardine, Extension Plant Pathologist, Kansas State University Department of Plant Pathology.)

The October 12 Crops Report predicted a 416 million bushel crop, down 1% from last year's crop. This production is from 3.25 million harvested acres, up 9% from last year. The predicted average yield of 128 bushels per acre is 13 bushels below that in 1999.

(From Kansas Agricultural Statistics.)

NORTHEASTERN KANSAS STANDARD CORN TEST ON SILT LOAM SOIL

COUNTY: DONIPHAN

LOCATION: Private farm 1 mile north of Severance

TEST SITE: Manona silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 150 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/19/00

HARVEST DATE: 9/8/00

COOPERATORS: Fuhrman Farms, Inc.

TARGET POPULATION: 25,000 plants/acre, 8.4 in. spacing

FINAL STAND (% of target): 104

SILK DATES: 7/13/00 - 7/18/00

YIELD: Avg. (bu/a): 189 Range (bu/a): 157 - 216

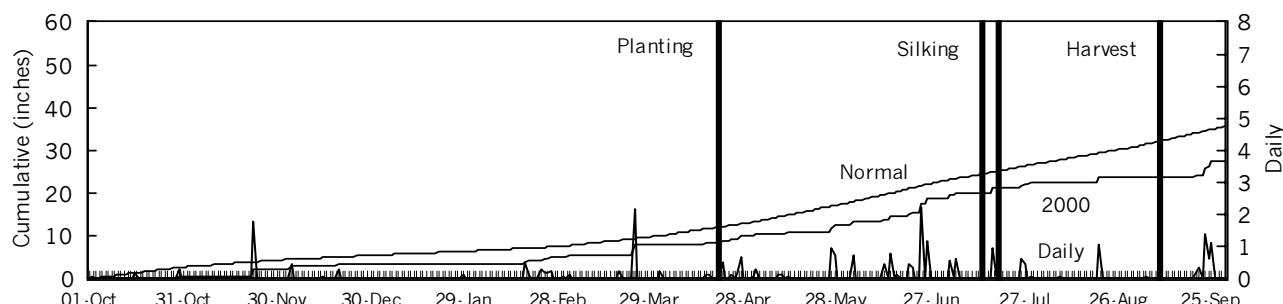

LSD (bu/a): 17 CV (%): 8

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

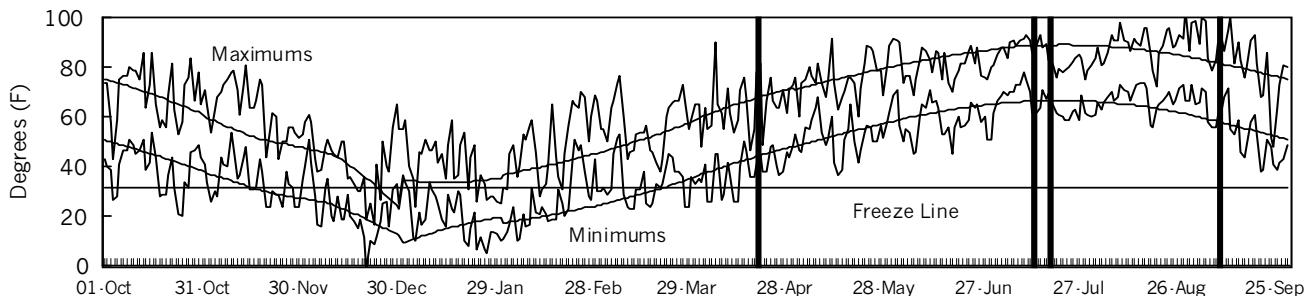

2000 GROWING CONDITIONS:

A slightly dry seedbed appeared not to decrease emergence and final stands. Flea beetles caused minimal damage in mid-May. Favorable rains through July enabled the hybrids to yield well, even though hot, dry conditions in August hastened maturation and dry-down.

YIELD: Avg. (bu/a): 113 Range (bu/a): 81 - 138

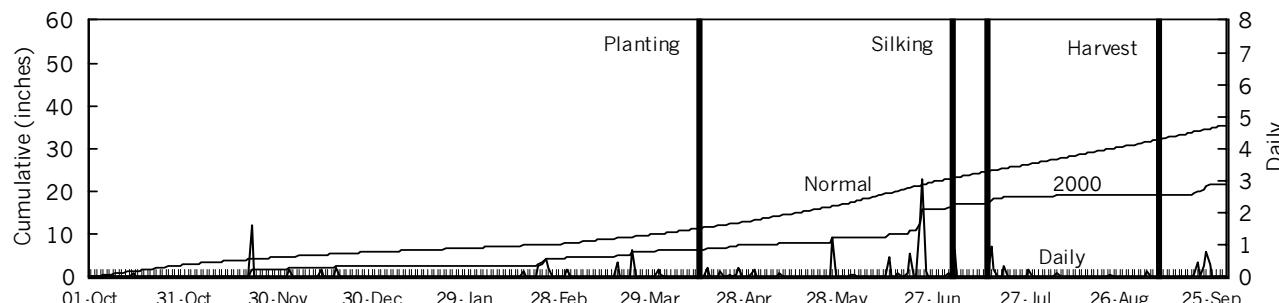

LSD (bu/a): 13 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

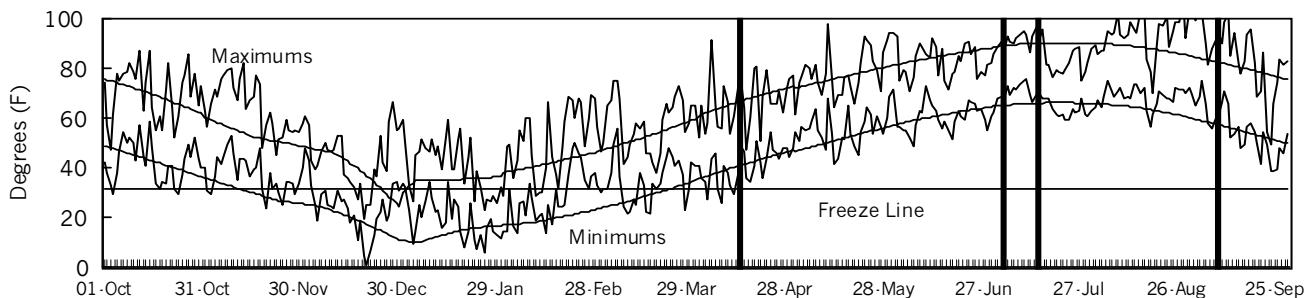

2000 GROWING CONDITIONS:

The hybrids established adequate stands and started off well, until an apparent infestation of flea beetles. The flea beetles caused some chlorosis and slowed seedling growth. Dry conditions extending back to last fall limited potential yields. The hot, dry August caused the test to mature and dry down very quickly and increased variability to some extent.

NORTHEASTERN KANSAS STANDARD CORN TEST ON SILT LOAM SOIL

COUNTY: RILEY

LOCATION: Agronomy North Farm near Manhattan

TEST SITE: Reading silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 130 N 30 P₂O₅ 0 K₂O

PLANTING DATE: 4/21/00

HARVEST DATE: 9/6/00

COOPERATORS: Kraig Roozeboom, agronomist; Karl Mannschreck, superintendent

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 107

SILK DATES: 7/2/00 - 7/9/00

YIELD: Avg. (bu/a): 176 Range (bu/a): 138 - 201

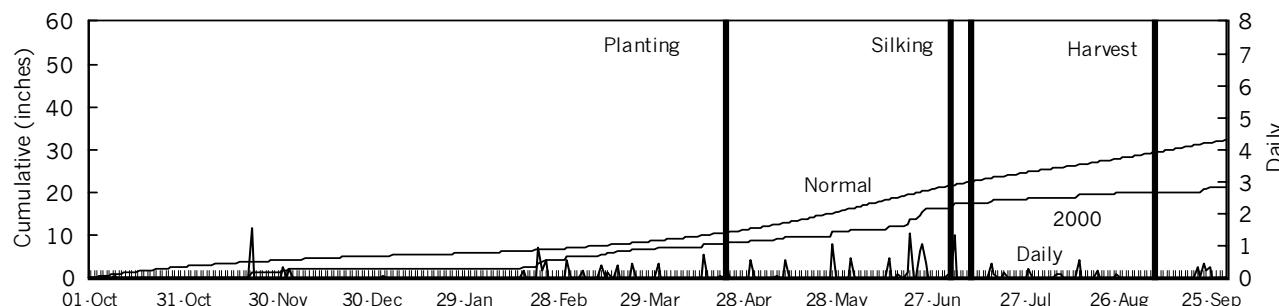

LSD (bu/a): 13 CV (%): 6

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

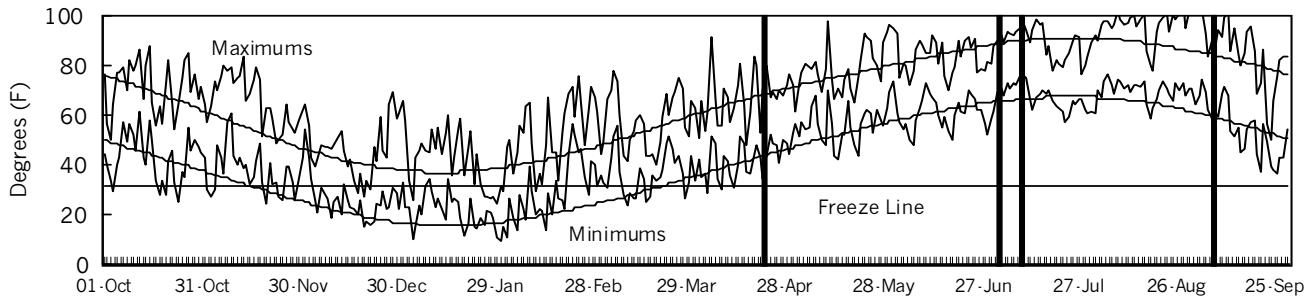

2000 GROWING CONDITIONS:

An excellent seedbed resulted in good stands. Flea beetles caused some damage at about the three-leaf stage, but the corn appeared to grow out of it fairly quickly. Adequate rainfall through July enabled the test to produce excellent yields, even though the grain filling period was shortened by heat and drought stress in August.

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

EAST CENTRAL KANSAS STANDARD CORN TEST ON SILT LOAM SOIL, IRRIGATED

COUNTY: SHAWNEE

LOCATION: Kansas River Valley Experiment Field, Silver Lake

TEST SITE: Eudora silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 160 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/12/00

HARVEST DATE: 9/1/00

COOPERATORS: Larry Maddux, agronomist; Charles Clark and William Riley, technicians

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 105

SILK DATES: 6/25/00 - 7/1/00

YIELD: Avg. (bu/a): 169 Range (bu/a): 137 - 204

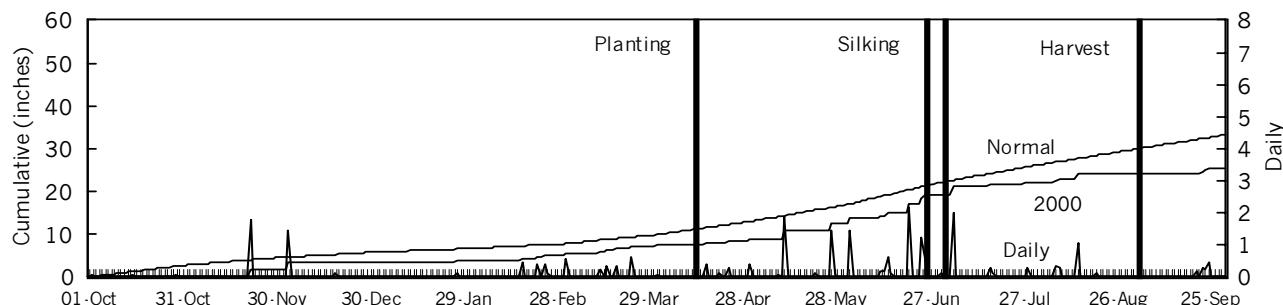

LSD (bu/a): 17 CV (%): 8

CORN BORERS: (susceptible hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
--	--	--	--	--

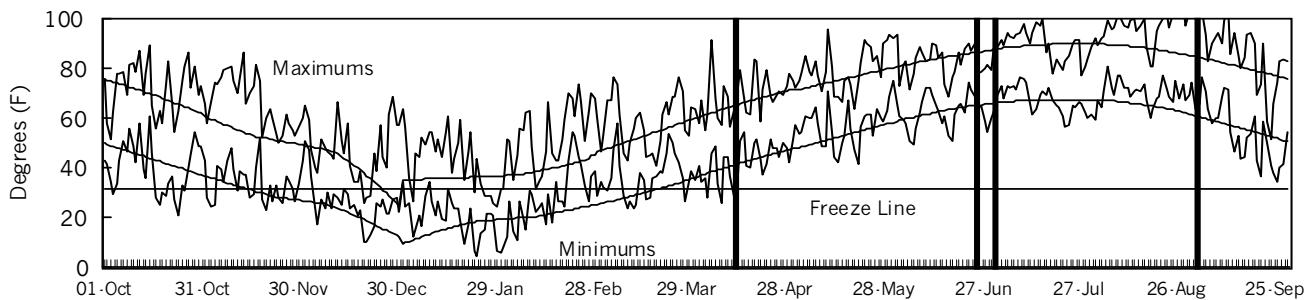

2000 GROWING CONDITIONS:

A warm April and good early-season growing conditions facilitated good early growth, although most of May was drier than normal. Early planting and silking enabled the test to set grain and mature before most of the heat and drought stress that arrived in August. An August windstorm caused considerable stalk lodging. Some cornborer damage also may have weakened some stalks.

NORTHEAST KANSAS STANDARD CORN TEST ON SILT LOAM SOIL, IRRIGATED

COUNTY: CLAY

LOCATION: Mark Taddiken farm near Clifton

TEST SITE: Muir silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 200 N 15 P₂O₅ 0 K₂O

PLANTING DATE: 4/25/00

HARVEST DATE: 9/21/00

COOPERATORS: Mark Taddiken; Taddiken Farm, Inc.

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 107

SILK DATES: 7/4/00 - 7/12/00

YIELD: Avg. (bu/a): 153 Range (bu/a): 111 - 180

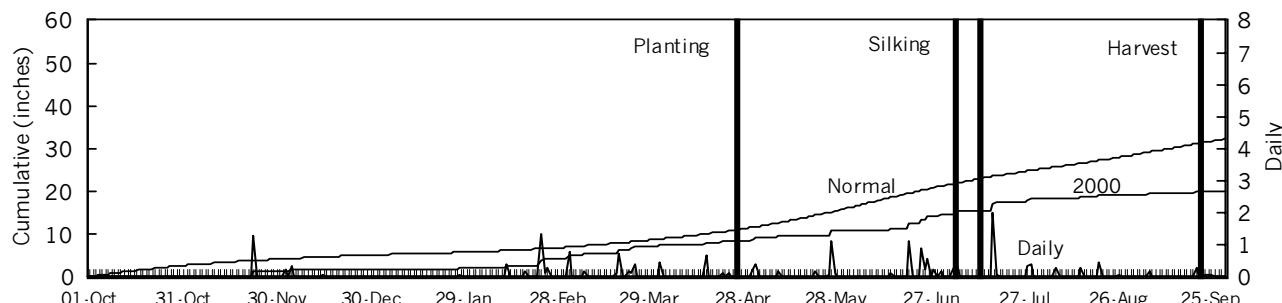

LSD (bu/a): 16 CV (%): 9

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

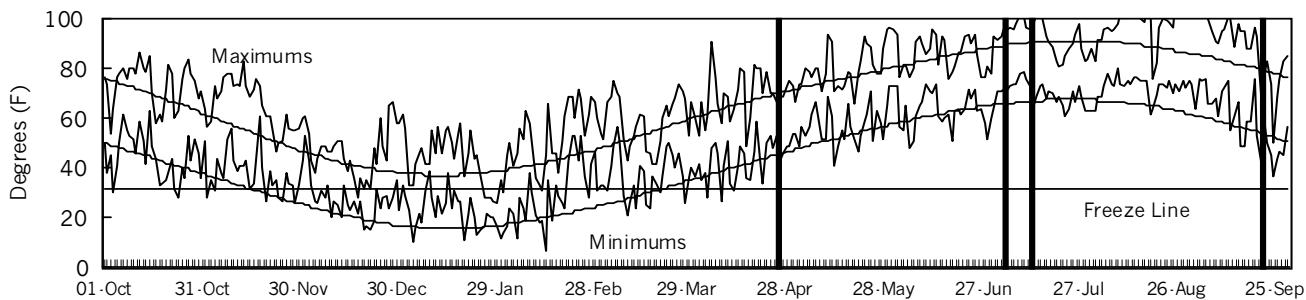

2000 GROWING CONDITIONS:

The test was no-till planted into soybean stubble with good moisture. Good stands and early growth got the test off to a fast start. Insecticide was applied on May 6 and May 22 to control flea beetles and dingy cutworm. Hot, dry conditions in August shortened grain fill, hastened dry-down, and weakened stalks. All hybrids had some level of lodging, but many were severely lodged.

NORTH CENTRAL KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: REPUBLIC

LOCATION: Irrigation Experiment Field, Scandia

TEST SITE: Crete silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 220 N 30 P₂O₅ 0 K₂O

PLANTING DATE: 4/17/00

HARVEST DATE: 9/20/00

COOPERATORS: Barney Gordon, agronomist; Michael Larson and Allan Milner, technicians

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 118

SILK DATES: 7/6/00 - 7/13/00

YIELD: Avg. (bu/a): 198 Range (bu/a): 153 - 228

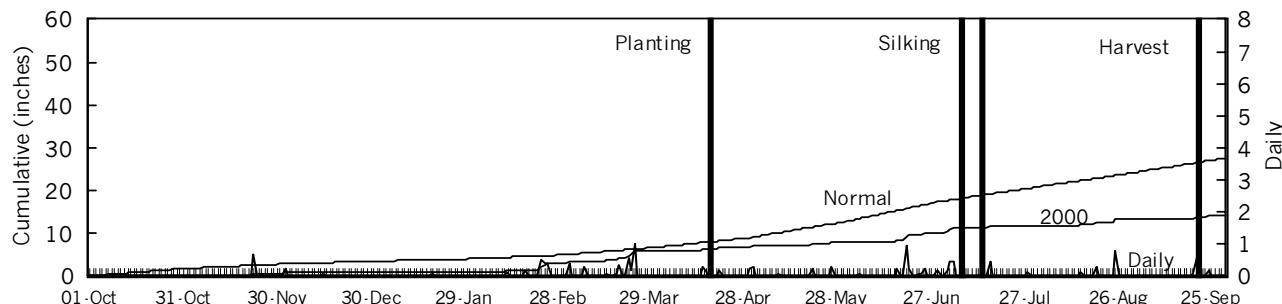

LSD (bu/a): 16 CV (%): 7

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susc. hybrid)	--	--	--	--

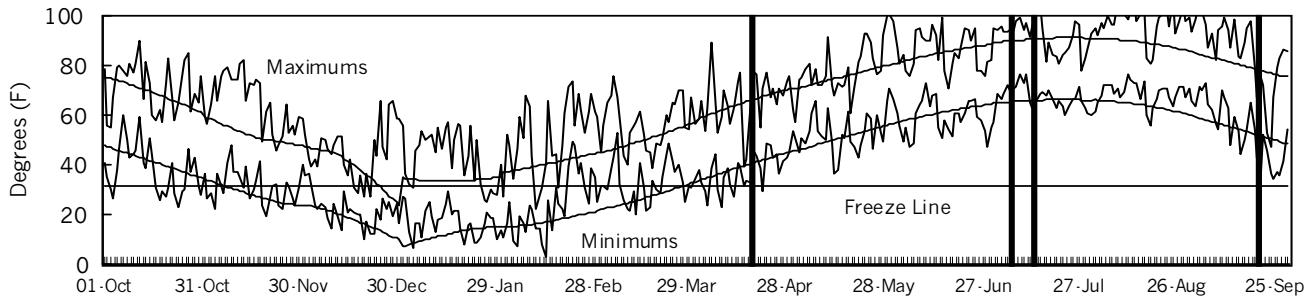

2000 GROWING CONDITIONS:

Favorable planting conditions resulted in excellent stand establishment. Dry, hot conditions characterized the rest of the growing season. Frequent irrigations maintained soil moisture, resulting in excellent yields.

EAST CENTRAL KANSAS STANDARD CORN TEST ON SILTY CLAY LOAM

COUNTY: SHAWNEE

LOCATION: Erma Harden farm northwest of Topeka

TEST SITE: Silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 140 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/12/00

HARVEST DATE: 9/1/00

COOPERATORS: Larry Maddux, agronomist; Charles Clark and William Riley, technicians; Hap Anderson and J.D. Hanna

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 95

SILK DATES: 6/25/00 - 7/3/00

YIELD: Avg. (bu/a): 141 Range (bu/a): 122 - 168

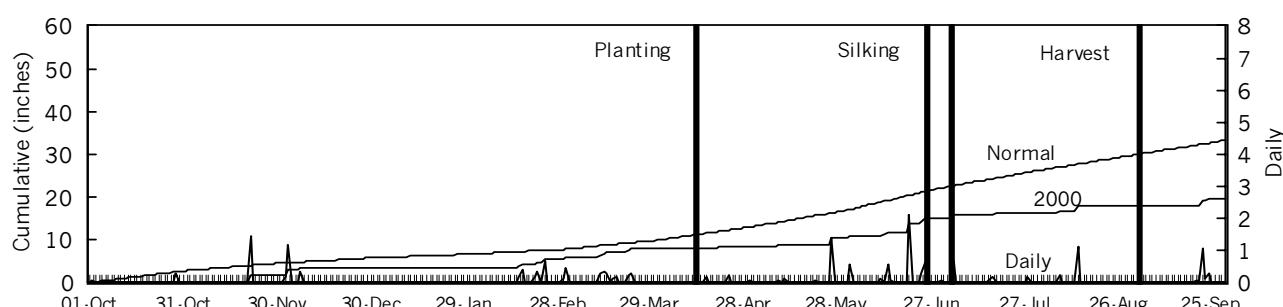

LSD (bu/a): 18 CV (%): 11

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

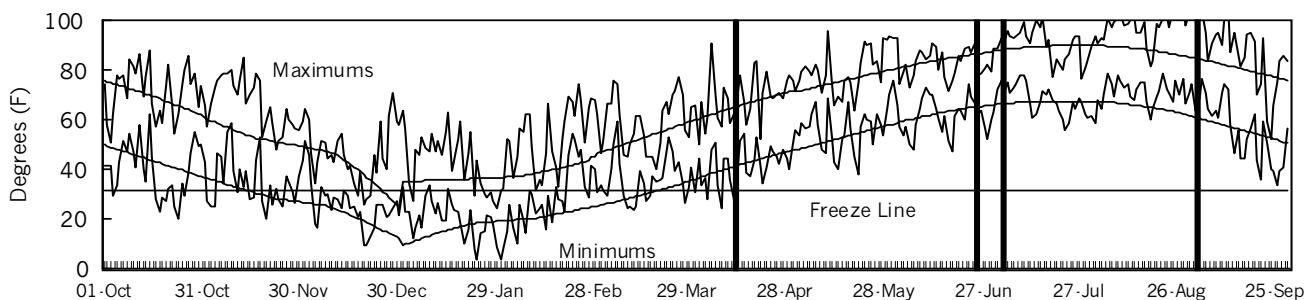

2000 GROWING CONDITIONS:

A warm April followed by favorable early-season growing conditions enabled a good start, although May was drier than normal. The good early-season growth set the stage for good yields. Early planting and silking helped avoid heat and drought stress during grain fill. Lodging and insect damage were minimal.

EAST CENTRAL KANSAS STANDARD CORN TEST ON UPLAND SILT LOAM SOIL

COUNTY: FRANKLIN

LOCATION: East Central Kansas Experiment Field, Ottawa

TEST SITE: Woodson silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 111 N 38 P₂O₅ 0 K₂O

PLANTING DATE: 4/14/00

HARVEST DATE: 9/9/00

COOPERATORS: Keith Janssen, agronomist; Jim Kimball, technician

TARGET POPULATION: 21,000 plants/acre, 10.0 in. spacing

FINAL STAND (% of target): 109

SILK DATES: 6/28/00 - 7/8/00

YIELD: Avg. (bu/a): 98 Range (bu/a): 53 - 119

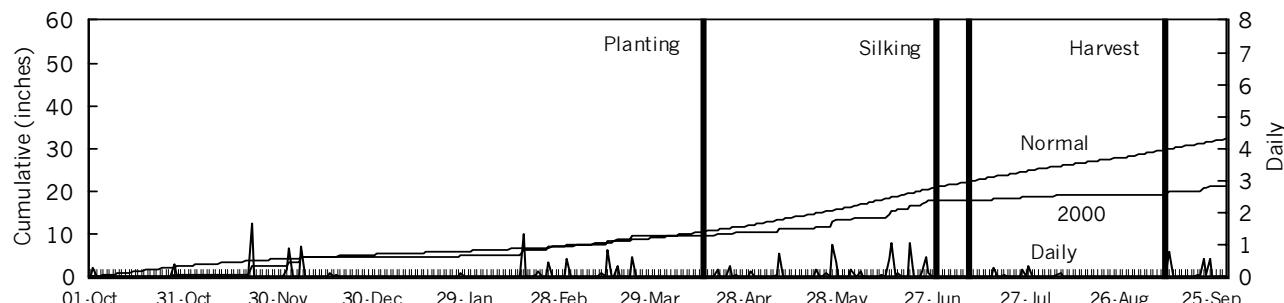

LSD (bu/a): 10 CV (%): 8

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

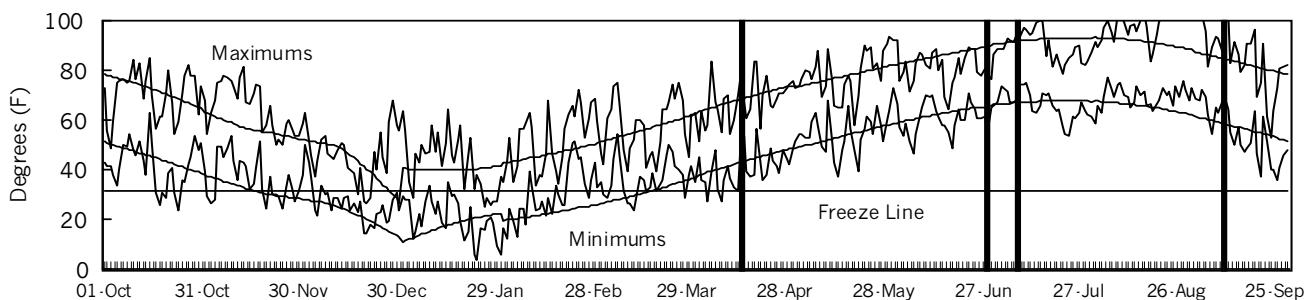

2000 GROWING CONDITIONS:

Favorable planting conditions resulted in good stands, but cool temperatures slowed early growth. Adequate rainfall through late June provided for good vegetative growth. Dry conditions during the rest of the growing season limited yields. The plants eventually died from lack of moisture rather than normal maturation and dry-down. Insects and diseases caused no visible problems.

SOUTHEASTERN KANSAS STANDARD CORN TEST ON RIVER-BOTTOM SOIL

COUNTY: NEOSHO

LOCATION: Private farm south of Erie

TEST SITE: Lanton silt loam

1999 CROP: Soybean

1998 CROP: Soybean

FERTILIZER (lbs/acre): 150 N 30 P₂O₅ 30 K₂O

PLANTING DATE: 4/14/00

HARVEST DATE: 8/31/00

COOPERATORS: James Long, agronomist

TARGET POPULATION: 24,000 plants/acre, 8.7 in. spacing

FINAL STAND (% of target): 102

SILK DATES: 6/24/00 - 7/2/00

YIELD: Avg. (bu/a): 162 Range (bu/a): 104 - 213

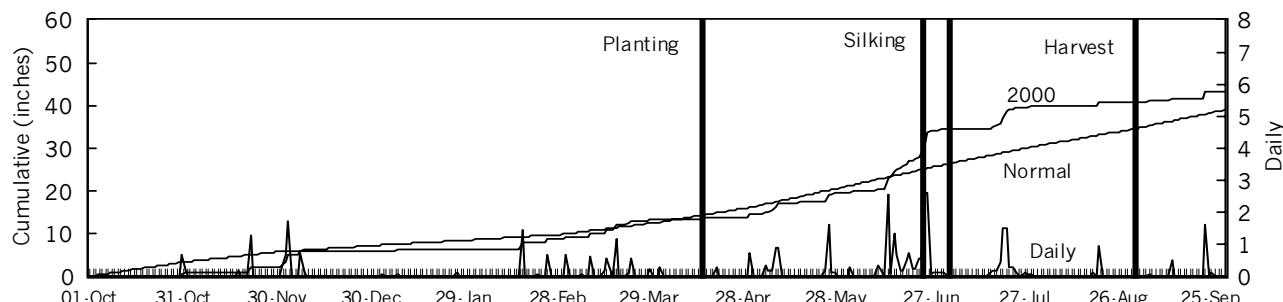

LSD (bu/a): 19 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

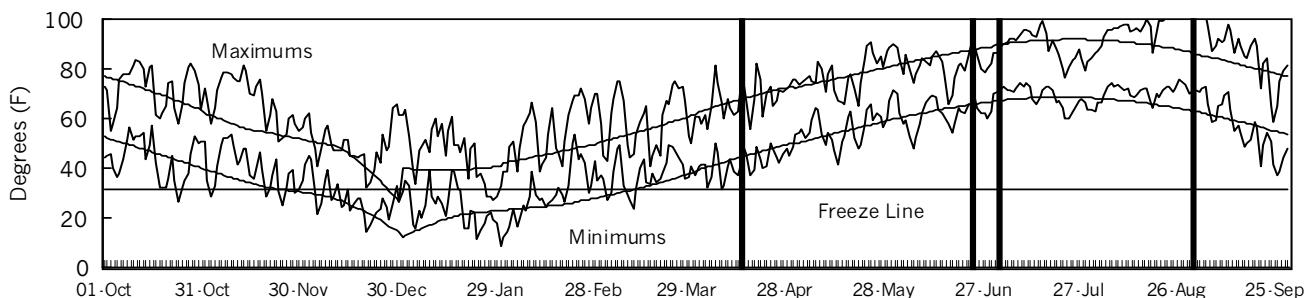

2000 GROWING CONDITIONS:

Cool, dry weather slowed early growth and root development. Seedling diseases killed some plants, and insects such as chinch bugs, wireworms, and grubs injured others. Stand variability increased as a result. Excellent rainfall from late spring until late July facilitated good yields. Adequate profile moisture enabled the test to finish well.

COOPERATORS: Mark Claassen, agronomist; Kevin Duerksen and Lowell Stucky, technicians

TARGET POPULATION: 20,000 plants/acre, 10.5 in. spacing

FINAL STAND (% of target): 98

SILK DATES: 6/24/00 - 7/7/00

YIELD: Avg. (bu/a): 96 Range (bu/a): 55 - 120

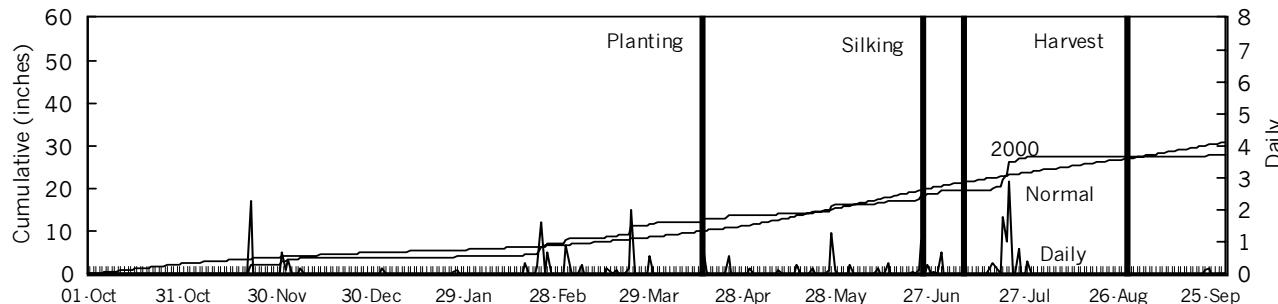

LSD (bu/a): 11 CV (%): 9

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

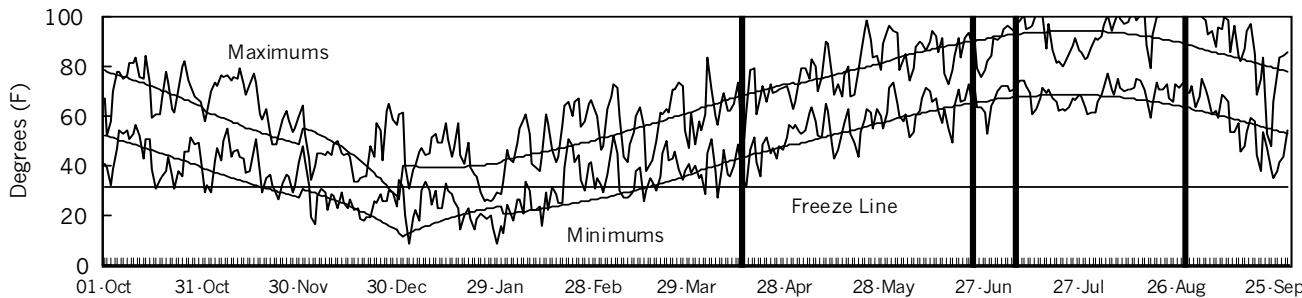

2000 GROWING CONDITIONS:

The test was planted into a good seedbed with excellent soil moisture. Temperatures and precipitation were below average from April-June. Heavy rainfall in late July coupled with favorable temperatures ensured a good crop even though no meaningful rainfall occurred after July 28. During August, the maximum temperature averaged 6.5F above normal. A moderate infestation of flea beetles in early-mid May, followed by an invasion of chinch bugs, caused no apparent long-term damage after an insecticide application.

SOUTH CENTRAL KANSAS CORN TEST, MIN-TILL DRYLAND

COUNTY: STAFFORD

LOCATION: Sandyland Experiment Field, St. John

TEST SITE: Naron loamy fine sand

1999 CROP: Wheat

1998 CROP: Fallow

FERTILIZER (lbs/acre): 193 N 46 P₂O₅ 0 K₂O

PLANTING DATE: 4/18/00

HARVEST DATE: 9/19/00

COOPERATORS: Victor Martin, agronomist; Ron Cunningham and Jeff Scott, technicians

TARGET POPULATION: 18,000 plants/acre, 11.6 in. spacing

FINAL STAND (% of target):

SILK DATES: 7/3/00 - 7/13/00

YIELD: Avg. (bu/a): 93 Range (bu/a): 71 - 108

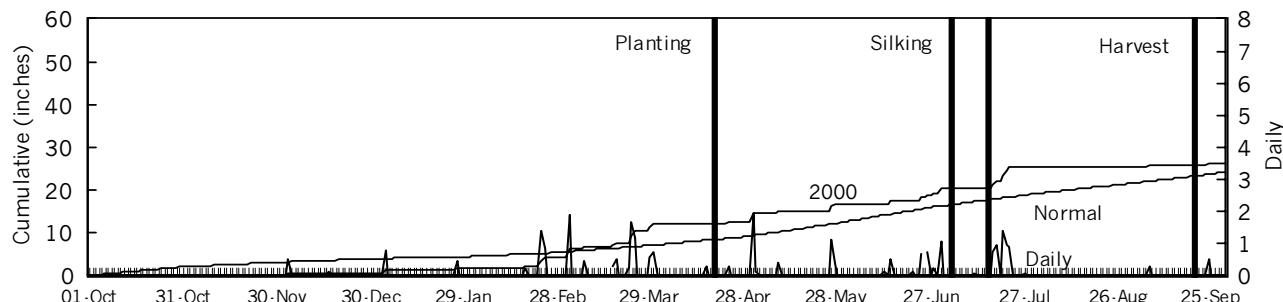

LSD (bu/a): 10 CV (%): 9

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	5	95	9	9/12/00

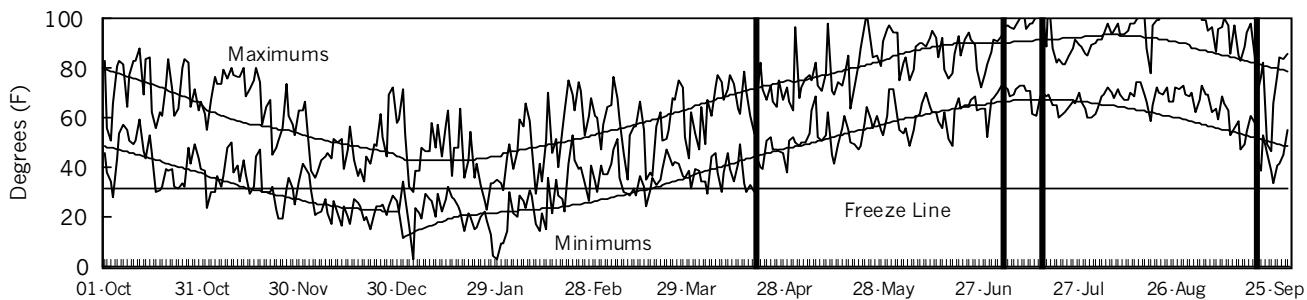

2000 GROWING CONDITIONS:

Good soil moisture under the standing wheat stubble enabled the test to establish good stands and get off to a good start. Adequate rains early in the season resulted in relatively good yields, considering the temperature and moisture stresses encountered in August. Heavy infestations of southwestern corn borers caused most, if not all, of the lodging.

NORTH CENTRAL KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: ELLIS

LOCATION: KSU Agricultural Research Center - Hays

TEST SITE: Harney clay loam

1999 CROP: Fallow

1998 CROP: Sorghum

FERTILIZER (lbs/acre): 65 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/25/00

HARVEST DATE: 9/8/00

COOPERATORS: Ken Kofoid, agronomist

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 100

SILK DATES: 7/9/00 - 7/17/00

YIELD: Avg. (bu/a): 85 Range (bu/a): 53 - 114

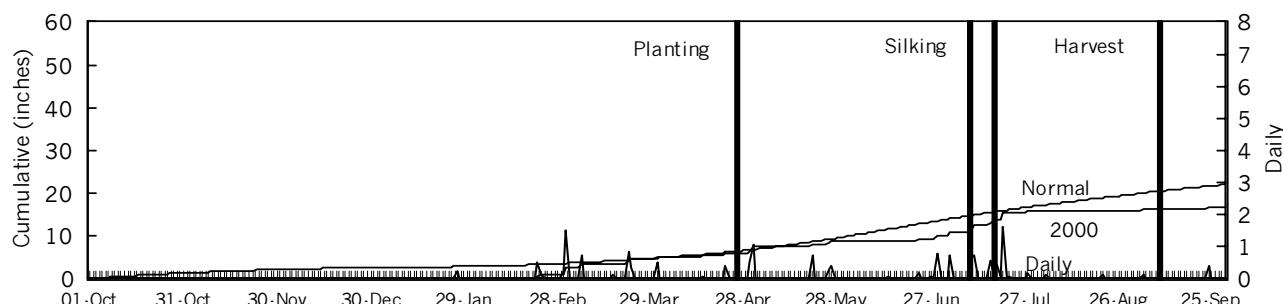

LSD (bu/a): 11 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	5	--	9/12/00

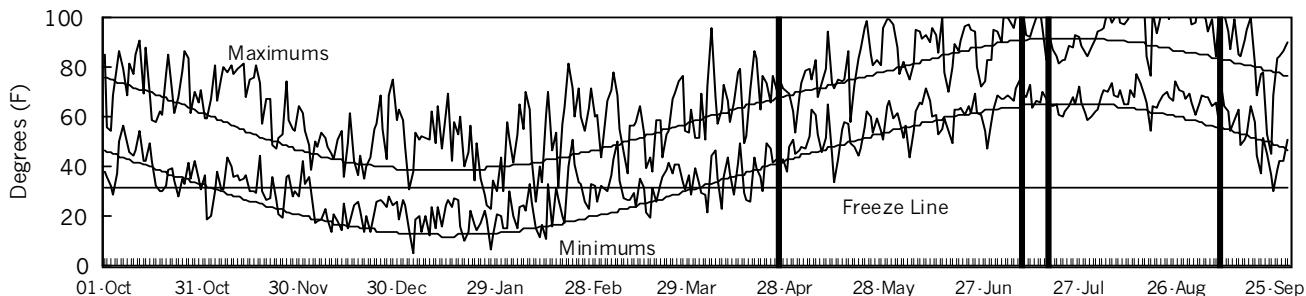

2000 GROWING CONDITIONS:

Above-normal temperatures and below-normal rainfall characterized June, August, and September. Spring and July rains carried the test to maturity. A heavy infestation of southwestern corn borer caused most of the lodging.

NORTHWESTERN KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: THOMAS

LOCATION: Northwest Research-Extension Center, Colby

TEST SITE: Keith silt loam

1999 CROP: Wheat

1998 CROP: Fallow

FERTILIZER (lbs/acre): 140 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/27/00

HARVEST DATE: 9/11/00

COOPERATORS: Patrick Evans, agronomist

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 93

SILK DATES: 7/18/00 - 7/30/00

YIELD: Avg. (bu/a): 28 Range (bu/a): 8 - 39

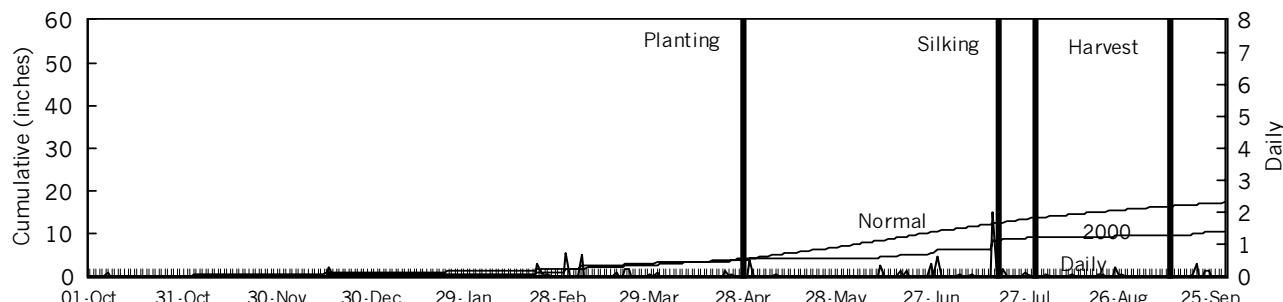

LSD (bu/a): 7 CV (%): 22

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	3	0	0.1	9/15/00

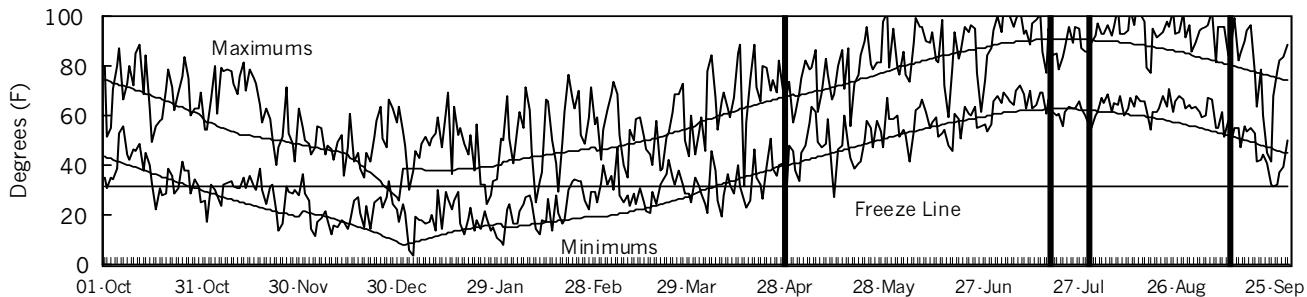

2000 GROWING CONDITIONS:

Fairly good planting conditions allowed adequate stand establishment in most plots. However, the dry winter and spring provided only 5.5" available soil moisture in the 8' profile at planting. Total precipitation from May to harvest was 6.24". Short-season hybrids tended to yield better than others because of the shortened grain filling period.

WEST CENTRAL KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: GREELEY

LOCATION: Southwest Research-Extension Center, Tribune

TEST SITE: Ulysses & Colby silt loam

1999 CROP: Wheat

1998 CROP: Fallow

FERTILIZER (lbs/acre): 105 N 17 P₂O₅ 0 K₂O

PLANTING DATE: 5/4/00

HARVEST DATE: 9/20/00

COOPERATORS: Alan Schlegel, agronomist; Ed Beason, agricultural technician

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 94

SILK DATES: 7/20/00 - 8/2/00

YIELD: Avg. (bu/a): 33 Range (bu/a): 18 - 47

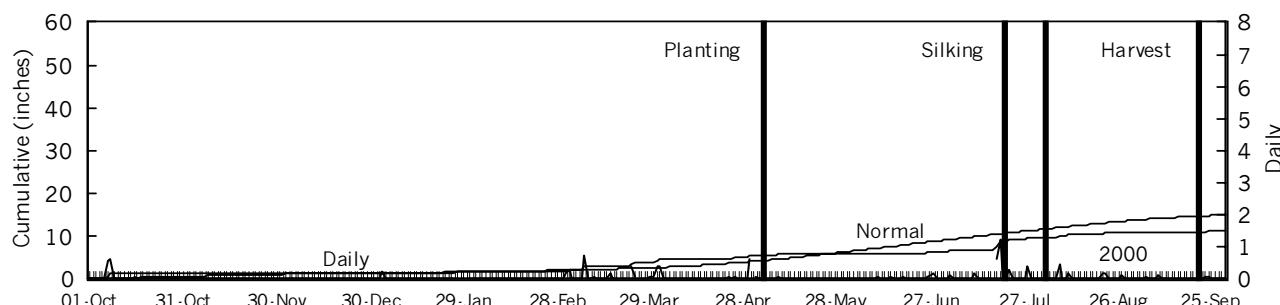

LSD (bu/a): 9 CV (%): 24

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	0	63	3.9	9/18/00

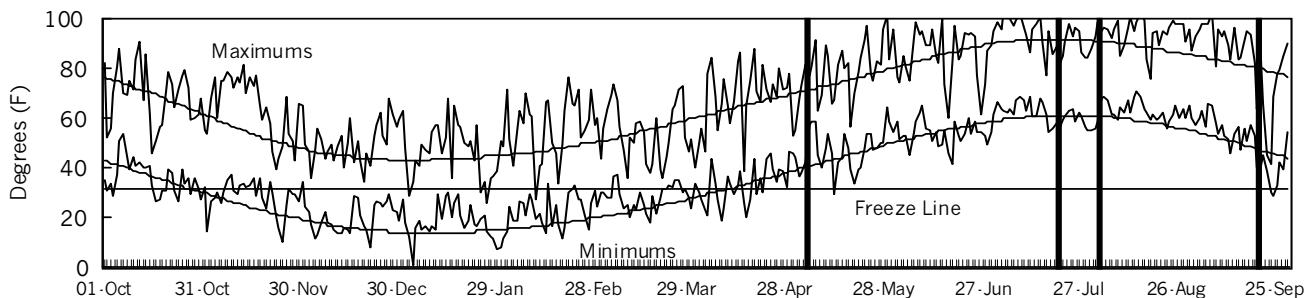

2000 GROWING CONDITIONS:

The test was planted into standing wheat stubble, providing moist soil conditions. Emergence was generally good, but stand variability was higher than desired. The overriding factor affecting hybrid performance was the dry, hot weather experienced during most of the growing season. The adverse conditions affected vegetative growth, kernel set, and grain fill.

**FIGURE 8. WEST Kansas NO-TILL, DRYLAND corn hybrid
standardized performance summary, 1998-2000.**

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

NORTHWESTERN KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: THOMAS

LOCATION: Northwest Research-Extension Center, Colby

TEST SITE: Keith silt loam

1999 CROP: Soybean

1998 CROP: Sunflower

FERTILIZER (lbs/acre): 250 N 30 P₂O₅ 0 K₂O

PLANTING DATE: 4/28/00

HARVEST DATE: 9/20/00

COOPERATORS: Patrick Evans, agronomist

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 114

SILK DATES: 7/11/00 - 7/21/00

YIELD: Avg. (bu/a): 185 Range (bu/a): 132 - 221

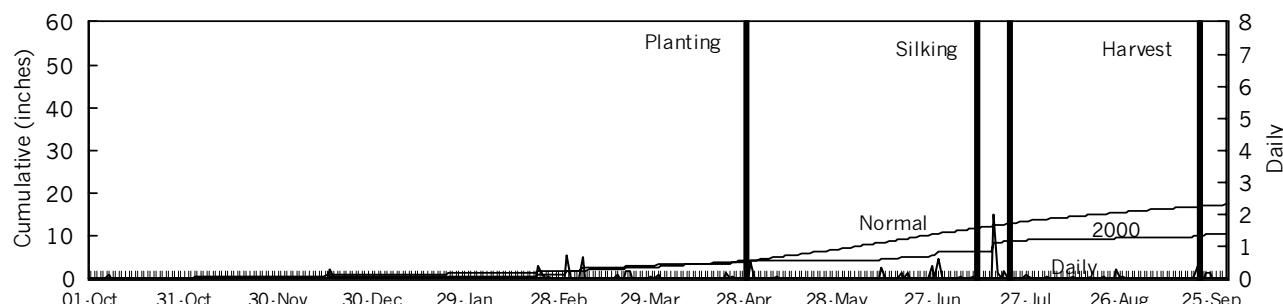

LSD (bu/a): 21 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	18	3	0.7	9/15/00

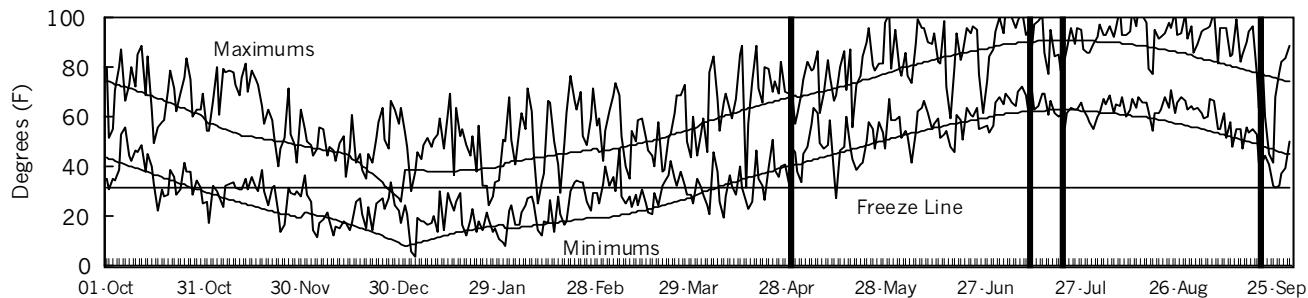

2000 GROWING CONDITIONS:

Aside from the hot, dry conditions during August and September, few problems arose during the season. Insects and diseases caused little, if any, damage.

WEST CENTRAL KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: GREELEY

LOCATION: Southwest Research-Extension Center, Tribune

TEST SITE: Ulysses silt loam

1999 CROP: Wheat

1998 CROP: Fallow

FERTILIZER (lbs/acre): 150 N 500 P₂O₅ 0 K₂O

PLANTING DATE: 4/21/00

HARVEST DATE: 10/1/00

COOPERATORS: Alan Schlegel, agronomist; Ed Beason, agricultural technician

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 93

SILK DATES: 7/24/00 - 8/1/00

YIELD: Avg. (bu/a): 111 Range (bu/a): 75 - 144

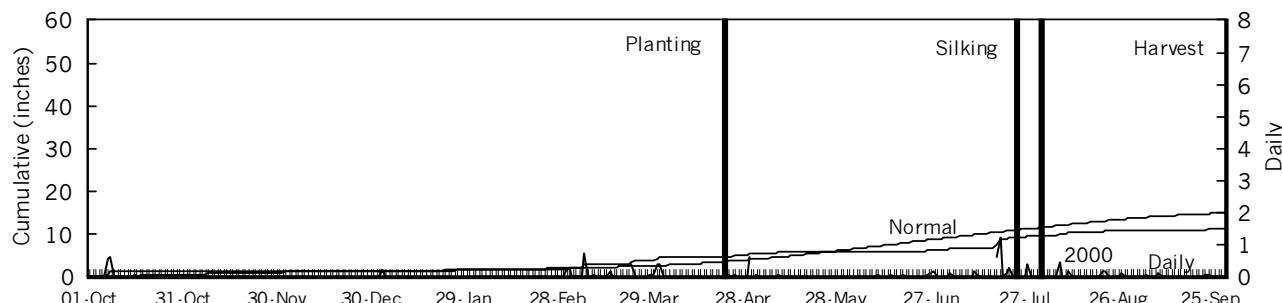

LSD (bu/a): 19 CV (%): 15

CORN BORERS: (susceptible hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
	0	50	3.2	9/18/00

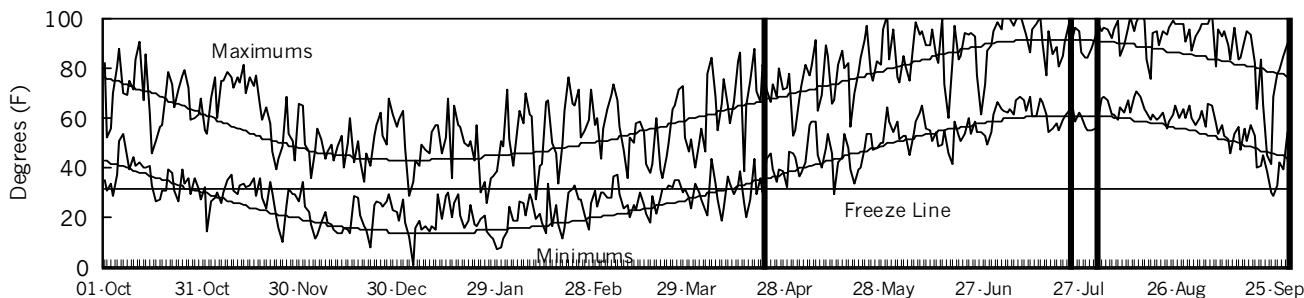

2000 GROWING CONDITIONS:

Heavy wheat residue remained after a high-yielding wheat crop in 1999. Dry conditions after planting resulted in erratic emergence and uneven early growth. The wheat residue appeared to tie up much of the available N, causing variable N-deficiency symptoms. An application of N and P fertilizer in the row at planting failed to overcome this early-season variability.

SOUTHWESTERN KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: FINNEY

LOCATION: Southwest Research-Extension Center, Garden City

TEST SITE: Keith silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 180 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/27/00

HARVEST DATE: 9/22/00

COOPERATORS: Merle Witt, agronomist

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 93

SILK DATES: 7/9/00 - 7/18/00

YIELD: Avg. (bu/a): 194 Range (bu/a): 132 - 227

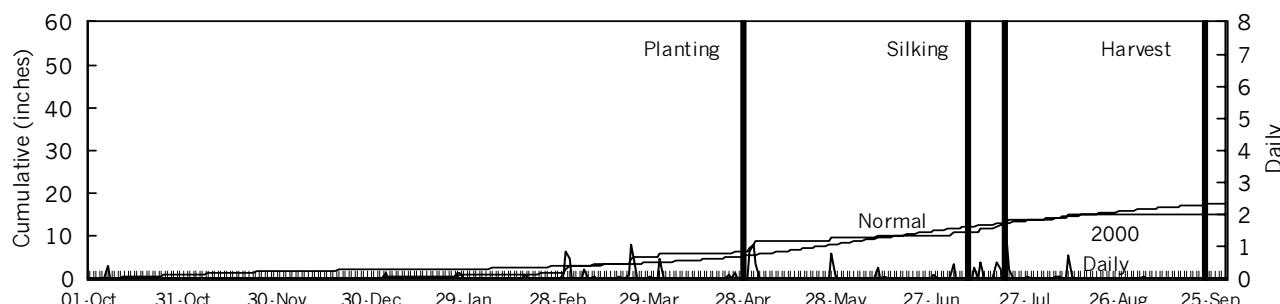

LSD (bu/a): 19 CV (%): 8

CORN BORERS: (susc. hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
0	23	1.5	9/19/00	

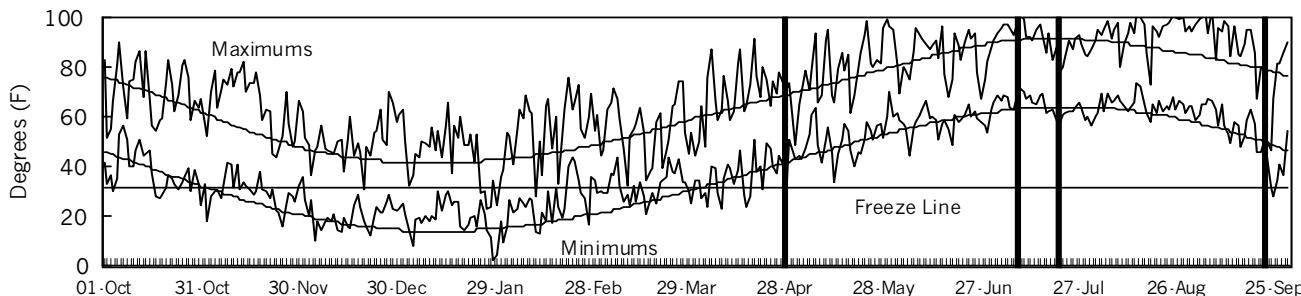

2000 GROWING CONDITIONS:

Emergence and early crop development were accelerated by the warm spring temperatures. This trend continued through the rest of the season with early silking, maturation, dry-down, and harvest.

EAST CENTRAL KANSAS SHORT-SEASON CORN TEST

COUNTY: FRANKLIN

LOCATION: East Central Kansas Experiment Field, Ottawa

TEST SITE: Woodson silt loam

1999 CROP: Soybeans

1998 CROP: Corn

FERTILIZER (lbs/acre): 111 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/12/00

HARVEST DATE: 8/28/00

COOPERATORS: Keith Janssen, agronomist; Jim Kimball, technician

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 107

SILK DATES: 6/27/00 - 7/7/00

YIELD: Avg. (bu/a): 94 Range (bu/a): 65 - 117

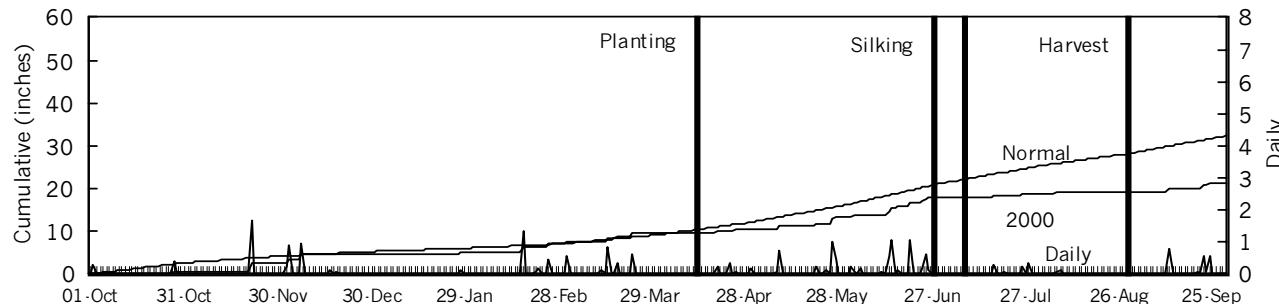

LSD (bu/a): 12 CV (%): 11

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

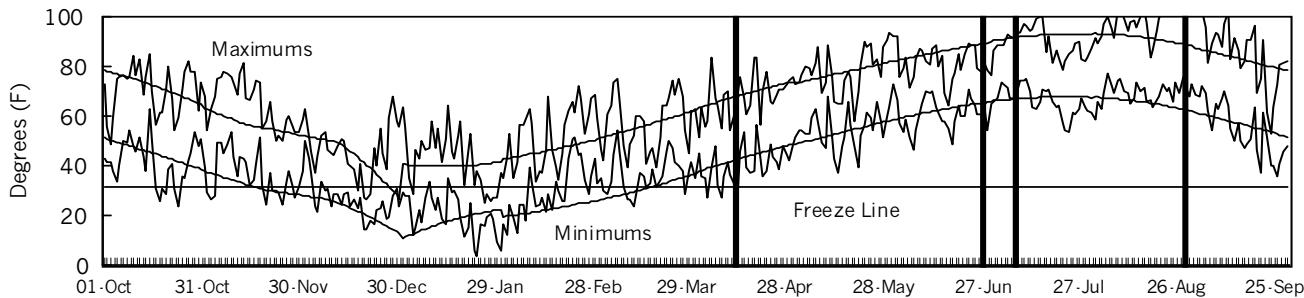

2000 GROWING CONDITIONS:

Dry conditions at planting caused some stand variability that appeared to carry through to harvest and affect yields. Cool temperatures slowed early growth. Adequate rainfall through late June provided for good vegetative growth. Dry conditions during the rest of the growing season limited yields and caused lodging in some hybrids. The plants eventually died from lack of moisture rather than normal maturation and dry-down. Insects and diseases caused no visible problems.

SOUTHEASTERN KANSAS SHORT-SEASON CORN TEST

COUNTY: CRAWFORD

LOCATION: Four-State Farm Show, Pittsburg

TEST SITE: Parsons silt loam

1999 CROP: Soybean

1998 CROP: Corn

FERTILIZER (lbs/acre): 180 N 53 P₂O₅ 53 K₂O

PLANTING DATE: 4/7/00

HARVEST DATE: 8/29/00

COOPERATORS: James Long, agronomist

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 122

SILK DATES: 6/20/00 - 6/29/00

YIELD: Avg. (bu/a): 169 Range (bu/a): 140 - 192

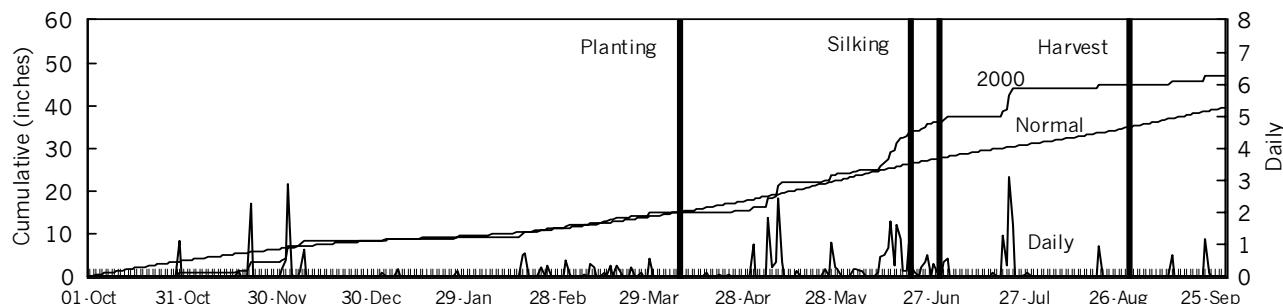

LSD (bu/a): 19 CV (%): 8

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

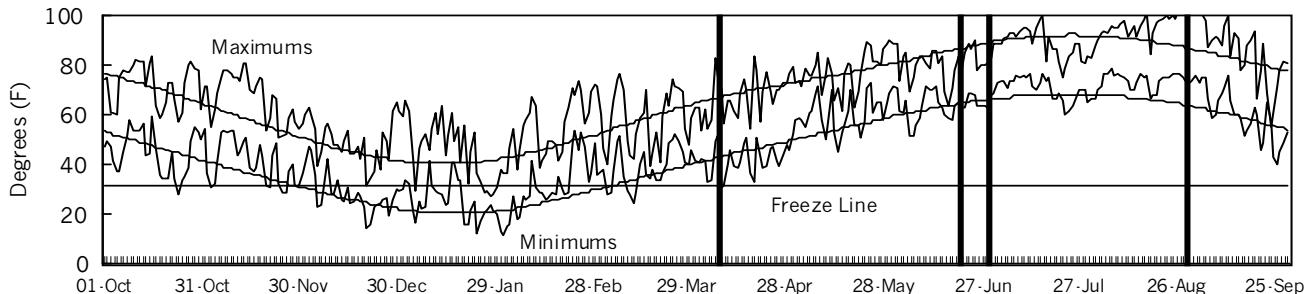

2000 GROWING CONDITIONS:

Seedling establishment was relatively problem free. Dry, cool conditions soon after planting gave way to wet conditions until late July. By that time, most hybrids were nearing maturity, so the hot, dry August had a minimal impact on yields.

ELECTRONIC ACCESS

For those interested in accessing crop performance testing information electronically, try visiting our World Wide Web site. Most of the information contained in this publication is available for viewing or downloading. The URL is <http://www.ksu.edu/kscpt>.

Excerpt from the

UNIVERSITY RESEARCH POLICY AGREEMENT WITH COOPERATING SEED COMPANIES*

Permission is hereby given to Kansas State University to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 825 '1998 Kansas Performance Tests with Soybean Varieties', or the Kansas Crop Performance Test website, <http://www.ksu.edu/kscpt>, for details. Endorsement or recommendation by Kansas State University is not implied."

These materials may be freely reproduced for educational purposes. All other rights reserved. In each case, give credit to the author(s), name of work, Kansas State University, and the date the work was published.

ACKNOWLEDGMENTS

Cooperation of Research Center and Experiment Field personnel who furnished land and performed many or all of the field operations is sincerely appreciated. Technicians Edward O. Quigley and James R. Cochrane packaged seed and performed field operations for some of the tests. Student intern Paul McGinness helped with seed counting, sign painting, and plot maintenance. Mary Knapp of the Weather Data Library provided much of the climatological information.
