Irrigated sorghum silage is produced for feed by livestock feeders and for cash sales to feedlots. Forage sorghum silage will generally out-yield corn silage. However, because of the lower feed value, sorghum silage is often valued less on a per unit basis. Research indicates that grain sorghum put up as silage has a higher feeding value than forage sorghum silage, but with lower yields. The type of silage to produce will depend somewhat on the producer's feeding program or the intended use of the silage buyer. Grain sorghum silage will be the choice of producers either feeding or backgrounding cattle at high rates of gain. Alternatively, feeders wintering calves at slow rates of gain for a summer pasture program would choose the higher yielding forage sorghum silage. Several varieties fall somewhere in between grain and forage sorghum that work well as silage. This budget is based on a forage sorghum put up as silage. The costs would be similar for grain sorghum put up as silage, but with lower yields.

Income Per Acre

Crop production costs per unit and net returns are highly dependent on yields. The following estimated budgets include three different yield levels, which are intended to represent expected yields for land of varying quality for a given level

of management. Producers can compare the profitability of crop enterprises on farmland tracts with varying yield potential by considering alternative expected yield scenarios. Land values and government payments have been adjusted for alternative yield levels in this budget. In customizing a budget to your farm, attention should be given to using land values representative of your farm's productive capacity and local farmland market conditions.

Costs Per Acre

Production costs at the three production levels are shown on lines 1 through 13. Kansas Custom Rates for specific field

operations are used to represent fuel and labor costs as well as machinery repair, depreciation, and interest expenses in these budgets. Table 1 identifies the typical seed, fertilizer, herbicide, insecticide, and irrigation water requirements (rate and cost/unit) for center-pivot-irrigated forage sorghum silage. Herbicide requirements include both pre-crop and in-crop treatments. Table 2 outlines the machinery, irrigation equipment, and land resources used for center-pivot-irrigated forage sorghum silage. Each tillage, planting, and harvest operation is identified.
