2017 CORN CROP REVIEW

Statewide Growing Conditions

The 2017 corn season had a very distinct weather pattern with different effects on the east, central, and western parts of the state. Wet conditions in the spring delayed planting in many locations. In addition, many fields exhibited early-season problems of lack of uniformity that impacted early growth and progress of the crop. Uneven corn stands can cause yield losses.

In general, for the early-planted corn, pollination did not occur under ideal moisture conditions (but this varied across the state), but grain-fill period was more favorable for corn yields in some areas of the state. Late-planted corn reached pollination in better weather environments, with drought affecting those regions earlier during the vegetative growth. Environments with adequate timing and quantity of precipitation during the growing season expressed high yield potential, with the opposite occurring when precipitation was erratic or not timely during the most critical corn growth stages (e.g., late-vegetative, flowering, and/or grain filling periods).

Hail was also a problem across the state. There were 586 reports of large hail through October 15. Of those events, 160 were reported in May. Hail has a larger impact when occurring around flowering time or during grain filling when the plant depends on the leaves, potentially affecting grain number and seed weight.

As related to the precipitation conditions, most production divisions averaged above normal for the period of April 1st through October 15. The greatest departure was in the West Central, where the divisional average was 19.74 inches or 123% of normal. The Northeast division faced the greatest shortfall, with an average of 23.59 inches or 89% of normal. At the Hiawatha station, rainfall dropped below normal in mid-June and continued below normal for the rest of the season. The western divisions enjoyed wetter than normal conditions through the summer, before entering a drier pattern in September and October.

Temperatures weren't as much of a factor. The warmest readings were seen in mid-July, with the highest read of 111°F reported on July 24 at Webster Dam and the Salina Airport. West Central Kansas did see a brief hot spell when Tribune reached 110°F on June 13. There were some late freeze dates, with multiple locations in Northwest Kansas dropping to 30°F on May 5. The first autumn freezes were later than average, with Sharon Springs dropping to 31°F on the 14th of October, and Concordia reaching 30°F on the 27th.

Luckily, the below-freezing temperatures did not affect corn since it did not match with the most sensitive stages during grain filling. Most of the crop was fully mature when the low temperatures occurred. Corn can be affected when temperatures are below or at 32°F. The colder below 32°F, the less exposure time it takes to damage the corn. However, corn is not affected once the black layer (physiologically mature) is formed.

Dry conditions impacted not only corn productivity but harvest may also have experienced some challenges when drought was a major factor. Drought-stressed corn may have high levels of aflatoxin. Aflatoxin levels may increase later if corn is held in storage at moisture levels above 14%. Ears may drop more easily, and a number of stalk rots may result in stalk lodging. Small ear sizes will prolong corn cutting, which can be especially frustrating when the timeliness of harvest is important.

In some areas of the state, wet conditions during the reproductive stages favored diseases in corn such as Diplodia ear and stalk rot. Diplodia ear rot affected cornfields across the state, producing white moldy growth and impacting the final weight and overall grain quality. In addition to the disease factor, late-season rainy conditions delayed harvest in many areas across the state, challenging the harvest progress.

Table 1. 2017 temperatures by crop production district

| Division | Extreme Tmax (oF) | Date | Avg Tmax (°F) | Avg Tmin (°F) | Avg Tmean (°F) | Extreme Tmin (°F) | Date |
|---------------|-------------------|--------|---------------|---------------|----------------|-------------------|--------|
| Northwest | | 22-Jul | 79.3 | 50.3 | 64.8 | 14 | 28-Oct |
| North Central | 111 | 22-Jul | 80.3 | 53.7 | 67.0 | 11 | 28-Oct |
| Northeast | | 21-Jul | 79.1 | 55.5 | 67.3 | 20 | 31-Oct |
| West Central | 110 | 17-Jun | 80.2 | 51.3 | 65.7 | 12 | 29-Oct |
| Central | | 23-Jul | 81.4 | 55.3 | 68.3 | 11 | 28-Oct |
| East Central | 108 | 23-Jul | 79.2 | 57.1 | 68.2 | 21 | 31-Oct |
| Southwest | | 23-Jul | 81.3 | 53.2 | 67.3 | 16 | 28-Oct |
| South Central | 108 | 23-Jul | 82.0 | 57.1 | 69.5 | 14 | 29-Oct |
| Southeast | 107 | 22-Sep | 79.8 | 57.5 | 68.6 | 22 | 29-Oct |

Despite the abovementioned challenges, USDA-NASS reported (10/12/2017) an overall corn yield of 134 bushels per acre for the state of Kansas for the 2017 growing season, with a final production estimate of 697 million of bushels (Ignacio A Ciampitti, Kansas State University Cropping Systems Specialist, and Mary Knapp, Kansas State University Climatologist).

Diseases

If one thing can be counted on in Kansas corn production, it is that when it comes to diseases, every year is different. One trend that continues is that southern rust is arriving earlier each year. Historically, southern rust arrived in mid-July to early August, but in recent years, it has arrived in late June to mid-July. In years with late-planted fields, this disease can easily result in 10 – 30% yield losses if not treated with a fungicide. Gray leaf spot levels in 2017 were down from the two previous years, but closer to the long-term average. Active scouting for corn bacterial streak, our most recently discovered foliar disease, resulted in 20 new counties being positive for the disease, bringing the total number of known infested counties in the state to 37. It remains to be determined if the disease significantly affects yield.

While 2106 was a good year for *Diplodia* ear rot in the state, lack of rain at and shortly after pollination resulted in much less of this disease across the state, with the exception of southwest Kansas, where *Diplodia* levels were surprisingly high. While *Aspergillus* ear rot, the cause of aflatoxin problems was present at its highest levels since 2012, actual levels of aflatoxin were surprisingly low, with highest levels occurring early in harvest and then steadily decreasing as harvest progressed. A second mycotoxin, fumonisin, produced by several species of *Fusarium*, became an issue for growers in the Panhandle of Texas. While some was found in Kansas cornfields, especially in southwest Kansas, toxin levels were generally low enough to not affect use of the corn.

Stalk rots losses were average in 2017. *Fusarium* stalk rot was by far the predominant disease found in grower fields, but charcoal rot, *Diplodia* stalk rot and anthracnose stalk rot were all reported at low levels around the state. (Doug Jardine, Kansas State University Department of Plant Pathology)

Insects

In general, corn pests throughout the 2017 growing season seemed to be less impactful than usual. Every year there are a few reports of black cutworm infestations in southeast Kansas, and 2017 was no exception. However, there were only about half as

many as in the previous 5 years. Chinch bugs also were problematic throughout south central and north central Kansas.

The one insect pest that has increased its infestation area is the Japanese beetle. While these pests have been reported in Kansas for more than 20 years, in the past 3-4 years they have increased in numbers and area, spreading from the northeastern quadrant of the state, from about 75 Highway north of Topeka to the Nebraska border on the north and the Missouri border on the east. The adult beetles are voracious at clipping corn silks and thus may be of concern depending upon infestation timing. (Holly Schwarting and Jeff Whitworth, Kansas State University Department of Entomology)

2017 PERFORMANCE TESTS

Objectives and Procedures

Corn performance tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and seed industry personnel with unbiased agronomic information on many of the corn hybrids marketed in the state. Entry fees from private seed companies finance the tests. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown uniformly at all test locations. Most companies submit seed treated with systemic insecticides, which can affect yield in some situations. A column listing insecticide seed treatments for each hybrid is included in Table 11 to help interpret yield results.

Three to four plots (replications) of each hybrid were grown at each location in a randomized complete-block design. Each harvested plot consisted of two rows trimmed to a specific length, ranging from 20 to 30 feet at the different locations.

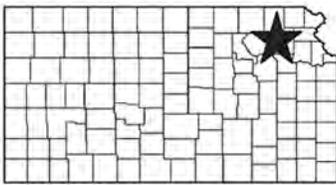

Explanatory information is given in summaries preceding data for each test. Tables 2 through 10 contain results from the individual performance tests. Hybrids are listed together by company name. A summary of growing season precipitation data is given for individual test discussions. General trends in precipitation relative to normal are readily observed in the graphs.

Grain yields are reported as bushels per acre of shelled grain (56 lb/bu) adjusted to a moisture content of 15.5%. Yields also are presented as percentage of test average to speed recognition of highest-yielding hybrids. Hybrids yielding more than 100% of the test average year after year merit consideration. Adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

Small differences in yield should not be overemphasized. Relative ranking and large differences are better indicators of performance. Least significant differences (LSD) are shown at the bottom of each table. Unless two hybrids differ by at least the LSD shown, little confidence can be placed in one being superior to the other. Yield values in the top LSD group in each test are displayed in bold. The coefficient of variability (CV) can be used in combination with the LSD to estimate the degree of confidence one can have in published data from replicated tests.

EASTERN KANSAS DRYLAND CORN TESTS

Ottawa, Franklin County
 East Central Experiment Field
 Planted: 4/13/2017
 Harvested: 9/22/2017
 140-40-13 lb/a N, P, K
 Woodson silt loam
 Previous crop: soybean

Kiro, Shawnee County
 Private farmer's field
 Planted: 4/12/2017
 Harvested: 9/22/2017
 180-0-0 lb/a N, P, K
 Silty clay loam
 Previous crop: soybean

Erie, Neosho County
 Private farmer's field
 Planted: 6/8/2017
 Harvested: 10/19/2017
 200-0-0 lb/a N, P, K
 Lanton silt loam
 Previous crop: soybean

*Seed treatment and hybrid traits located in Table 11.

**Yields in bold are not statistically different than the highest-yielding hybrid.

***Yields must differ by more than the LSD value to be considered statistically different.

WESTERN KANSAS IRRIGATED CORN TESTS

Colby, Thomas County

K-State Northwest Research Center

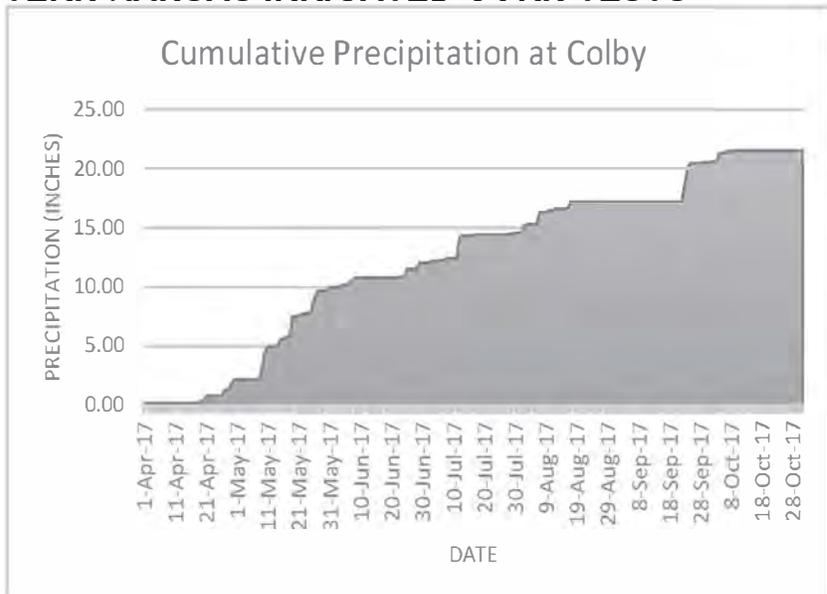

Planted: 5/8/2017

Harvested: 11/15/2017

230-50-0 lb/a N, P, K

Keith silt loam

Previous crop: fallow

Tribune, Greeley County

K-State Northwest Research Center

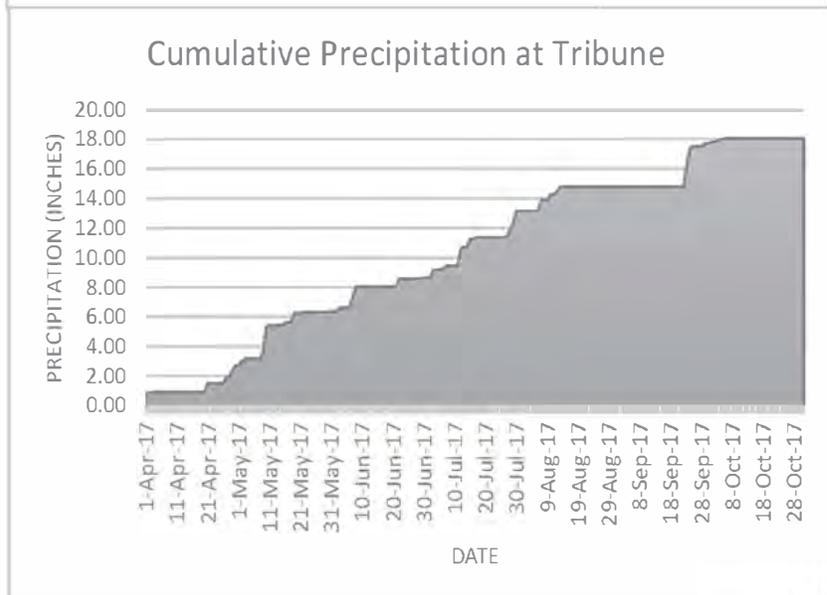

Planted: 4/26/2017

Harvested: 10/27/2017

250-40-0 lb/a N, P, K

Ulysess silt loam

Previous crop: fallow

Garden City, Finney County

K-State Southwest Research Center

Planted: 5/16/2017

Harvested: 10/26/2017

220-0-0 lb/a N, P, K

Keith silt loam

Previous crop: wheat

*SD TRT = Seed treatment (C=Cruiser, ACC=Acceleron, P=Poncho, VOT=Votivo. Numbers indicate rates if available); GDD = growing degree days; DBL = days to black layer; RES = herbicide, disease, and insect resistance traits [(Bt, BtCB, CB, YG, YG1, YG+, YGCB), Hx = transgenic corn borer protection; BtRW, RW, YGRW, HxRW = transgenic rootworm protection; CL, I, IT, IMI = imidazolinone resistant/tolerant; LL = Liberty Link; RR = Roundup Ready; TS, T = Triple Stack (RRCBRW)]; P = prolific; F = flex ear. Values provided by entrants.

Excerpts from the
University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1136, '2017 Kansas Performance Tests with Corn Hybrids,' or the Kansas Crop Performance Test website, www.agronomy.k-state.edu/services/crop-performance-tests/index.html, for details. Endorsement or recommendation by Kansas State University is not implied."
