Nutritive Value of Forages as Affected by Soil and Climatic Differences
(Project 430).

D. Richardson, E. E. Banbury,¹ A. B. Erhart,² Grady Williams,³ Oliver Russ,² E. F. Smith, L. H. Harbers, D. C. Loper, and R. F. Cox

This is a progress report on the second test to determine whether there is a difference in the performance of beef steers due to location, soil, climate, rainfall and/or feed produced in four areas of Kansas: Colby, Garden City, Manhattan, and Mound Valley. Forty-eight Hereford steer calves averaging 454 pounds each were divided into four groups of 12. One lot was assigned to each location. Sorghum silage from the same variety (FSIA) and second cutting of alfalfa plus plain salt were used in the wintering phase. Feedstuff analyses are shown in Table 34, and results of the wintering phase, in Table 35. Silage has been removed from the ration and sorghum grain added. The animals will be fattened for slaughter.

1. Colby Branch Station.

2. Garden City Branch Station.

3. Mound Valley Branch Station.

Table 35
Results of the wintering phase, November 8, 1963, to February 28, 1964—112 days.

Location	Colby		Garden City		Manhattan		Mound Valley	
	1	2	1	2	1	2	1	2
Lot no.
No. steers per lot	6	6	6	6	6	6	6	6
Av. initial wt., lbs.	454.2	454.2	453.3	454.2	453.2	454.2	454.2	453.3
Av. final wt., lbs.	572.1	590.1	649.0	616.8	619.2	607.5	608.5	575.7
Av. daily gain, lbs.	1.05	1.21	1.75	1.45	1.48	1.37	1.38	1.09
(46) Av. daily ration, lbs.:
