2013 WHEAT CROP REVIEW

Weather and Crop Development

Following the drought-stricken conditions of 2012, the 2012-2013 Kansas wheat crop struggled to get established early in the growing season. Snowfall in December and February helped the wheat get through the winter months, but it was not until March that state-wide rains and warm temperatures improved the condition of the wheat crop.

The warm temperatures did not continue, however, and many fields were damaged by hard freezes in late April. May brought more fluctuations of warm-then-cool temperatures, slowing progress of the crop to a more normal rate of development than in 2012, which ranked as the earliest on record for Kansas. Many acres of wheat received a boost from rains during grain fill, but in general, the wheat crop in Kansas was not able to overcome the persistent dryness and challenging conditions. At harvest, 33% of the crop was rated as good or excellent, 24% was rated as fair, and 43% was rated as poor to very poor. (*Crop Progress and Conditions* report, Kansas Agricultural Statistics)

Diseases

The influence of diseases on wheat production was low in 2013 relative to many recent years. Both stripe rust and leaf rust remained at low levels in most areas of the state this year, but moderate levels of rust were reported in the Southeast and South Central regions. Tan spot and Septoria tritici blotch also made their presence known in the southeast and south central regions of the state, where severe disease developed late in the season and hastened the decline of the flag leaves during the dough stages of kernel development.

Although viral diseases were present in many fields again this year, the incidence of barley yellow dwarf was much lower than in previous three years. Wheat streak mosaic caused severe damage in some areas of eastern and central Kansas. In most cases, fields with severe wheat streak mosaic were associated with poor control of volunteer wheat the previous summer. The incidence of wheat streak mosaic was below normal in western Kansas for the second year in a row. This low incidence of wheat streak mosaic is likely the result of persistent drought in this region of the state. (Erick De Wolf and Bill Bockus, Kansas State University Plant Pathologists)

Insects

There were sporadic reports of greenbugs and bird cherry-oat aphid infestations from southeast and south central Kansas in mid-October to mid-November, but infestations never really materialized into any significant problems, and sampling for barley yellow dwarf virus, in plants where aphids were reported also proved insignificant.

Spring infestations of English grain aphids became very significant in many areas across the state just as the berries were filling. Some growers sprayed for these aphids but most did not, and lady beetles eventually controlled the aphids or the wheat matured to the point where the aphids could no longer suck juice from the developing berry. English grain aphids are common throughout wheat fields in the spring, but populations that developed in 2013 were much more significant than in past years.

Several reports of wheat curl mites and wheat streak mosaic disease were verified (as far east as Highway 77). Controlling volunteer wheat and planting as late as agronomically practical is still the best way to minimize problems caused by these pests. (Jeff Whitworth, Kansas State University Extension Entomologist)

Harvest Statistics

The Kansas Agricultural Statistics June 12 estimate of the 2013 crop was 307.8 million bushels from 8.1 million acres, down 21% from last year's crop. Yield per harvested acre is expected to average 38 bushels, down 4 bushels from last year's final yield. (June 12, 2013, *Crops Report*, Kansas Agricultural Statistics)

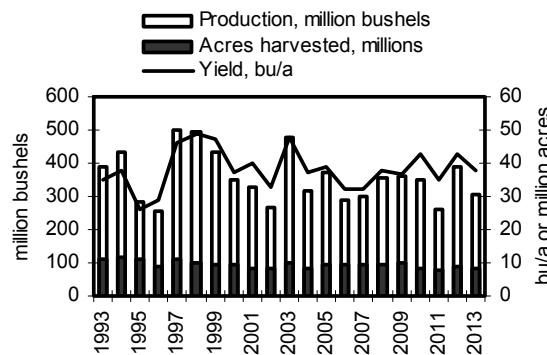

Figure 1. Historical Kansas wheat production

Everest became the leading variety of wheat seeded in Kansas. It accounted for 14.3% of the state's wheat and was the most popular variety in the eastern two-thirds of the state. TAM 111 fell to second with 10.8% of acreage and is the leading variety in the western third of the state. Armour remained in third place with 6.7%. TAM 112, and Fuller switched spots in the ranking, accounting for 5.1% and 4.2% of wheat acres, respectively. (February 8, 2013, *Wheat Variety*, Kansas Agricultural Statistics)

Acreage Distribution

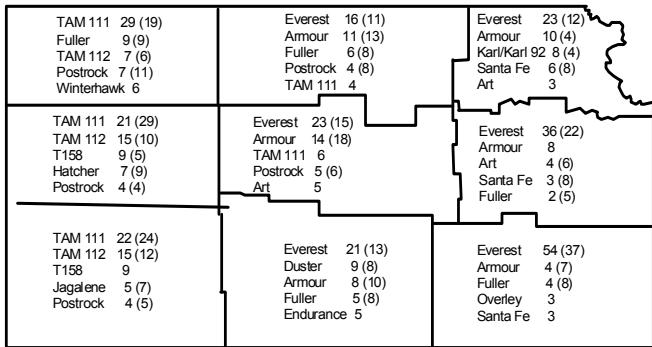

Figure 2. Leading wheat varieties in Kansas; percentage of seeded acreage for 2013 and (2012) crops

2013 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Site descriptions and management practices for each site are summarized in Table 3. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions.

Environmental Factors

Drought and freeze damage were determining factors in many of the tests in the 2012-2013 growing season. Be sure to keep extenuating environmental conditions in mind when examining test results.

Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Nebraska, Oklahoma, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution. Twenty-six public wheat varieties were entered for testing.

Originators or marketers enter privately developed varieties on a voluntary basis. Entrants choose both the entries and test sites. The 2013 private entrants are listed in Table 1. Eight private entrants provided a total of 37 varieties for testing.

Table 13 describes the characteristics of seed submitted for testing. Seed quality—including factors such as size, purity, and germination—can be important in determining

the performance of a variety. Wheat seed used for entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Performance of a given variety similar to that obtained in these tests is best assured under similar environmental and cultural conditions and with the use of certified or professionally prepared seed.

Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 12. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) LSD (least significant difference) for each column of replicated data. One can think of the LSD as a “margin of error” that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

Electronic Access

To access crop performance testing information electronically, visit the website at: <http://www.agronomy.ksu.edu/kscpt>

Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety, provided the source is referenced and data are not manipulated or reinterpreted; and 2) advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with

no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1090 '2013 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, <http://www.agronomy.ksu.edu/kscpt> for details. Endorsement or recommendation by Kansas State University is not implied."

¹ Hard white variety
² Varieties and percentage seeded acreage from the Feb. 8, 2013, wheat variety survey, Kansas Agricultural Statistics, Topeka, KS.

³ Most ratings are estimates based on information and observations from many sources over several years. Agronomic information by Joe Martin - Hays, and Allan Fritz, Jim Shroyer, and Steve Watson - K-State Agronomy.

⁴ Summary of crop performance test results from recent years.

⁵ Ratings from Rebecca Miller - K-State Wheat Quality Laboratory.

EX = Exceptional; large kernels; high protein content; very good milling, mixing, and commercial bread-baking.
 AC = Acceptable; milling and baking attributes acceptable, but not outstanding, for all properties; may have minor defects.
 LD = Less Desirable; one or more serious quality defects.
 -- = Inadequate information or conflicting data.

⁶ Strong blending wheat; needed for blending with weaker wheats; may not be suitable alone for bread flour.

Final ratings and descriptions of milling and baking quality are available in "Milling and Bread Baking Quality of Kansas Hard Winter Wheat Varieties 2013," Publication MF1077 from Kansas State University.

⁵ Ratings by Allan Fritz - Manhattan, Joe Martin - Hays, Erick DeWolf and Bill Bockus - K-State Plant Pathology, Jeff Whitworth - K-State Entomology.

Final ratings and descriptions of disease and insect pests are available in "Wheat Variety Disease and Insect Ratings 2013," Publication MF991 from Kansas State University.

⁶ New Russian wheat aphid biotype is thought to be virulent on all currently available commercial varieties.

Table 3. Wheat performance test site descriptions and management in 2013

Region and location	Soil type previous crop	N	P₂O₅	K₂O	Plant-harvest seed rate	Conditions
<u>Northeast Dryland</u>						
Ashland Agronomy Farm Manhattan (MA)	Reading silt loam Soybean	70	--	--	Fall 75 lb/a	Variable stands due to dryness in the fall.
<u>Southeast Dryland</u>						
East Central KS Experiment Field Ottawa (OT)	Woodson silt loam Grain sorghum	75	52	23	Fall 60 lb/a	Very good growing conditions during grain fill.
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	50	0	0	Fall 75 lb/a	Good stands but wheat did not tiller well in the fall. Wheat had moisture stress until late February.
<u>Soft Wheat</u>						
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	50	0	0	Fall 75 lb/a	Good stands but wheat did not tiller well in the fall. Wheat had moisture stress until late February.
<u>North Central Dryland</u>						
North Central KS Experiment Field Belleville (BE)	Crete silt loam Fallow	80	30	0	Fall 90 lb/a	Cool, late spring.
North Central KS Farmer's Field Beloit (BL)	Harney silt loam Wheat	100	80	0	Fall 80 lb/a	Cool, late spring.
<u>Central Dryland</u>						
Central KS Farmer's Field Gypsum (GY)	Silty clay loam Fallow	50	--	--	Fall 90 lb/a	Dry in the fall but rebounded for decent performance.
Central KS Farmer's Field Lorraine (LR)	McCook silt loam Fallow	60	--	--	Fall 60 lb/a	Test struggled to establish a stand in the fall.
<u>South Central Dryland</u>						
South Central KS Farmer's Field McPherson (MC)	Crete silt loam Fallow	60	--	--	Fall 60 lb/a	Very dry fall and winter months.
South Central KS Experiment Field Hutchinson (HU)	Ost silt loam Fallow	80	40	--	Fall 60 lb/a	Dry conditions throughout growing season.
South Central KS Farmer's Field Conway Springs (CW)	Sandy loam Fallow	40	--	--	Fall 60 lb/a	Very dry fall and winter months.
<u>Northwest Dryland</u>						
Agricultural Research Center Hays (HA)	Harney silt loam Fallow	80	--	--	Fall 50 lb/a	Good conditions throughout growing season.
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	60	25	0	Fall 60 lb/a	Winter had little snowfall. A hard freeze in April set everything back with 1 variety with severe winter kill.
Northwest Research-Extension Center Tribune (TR)	Richfield silt loam Fallow	65	20	0	Fall 55 lb/a	Test had good moisture in the fall; dry for rest of the season.
Northwest KS Farmer's Field Wakeeny (WA)	Harney clay loam Grain Sorghum	50	20	0	Fall 50 lb/a	Dry conditions throughout season.
<u>Southwest Dryland</u>						
Southwest KS Farmer's Field Larned (LA)	Harney clay loam Grain sorghum	75	0	0	Fall 50 lb/a	Decent growing season.
Southwest KS Farmer's Field Dodge City (DC)	Harney clay loam Fallow	60	--	--	Fall 45 lb/a	Abandoned; no stand established in fall.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Wheat	60	--	--	Fall 65 lb/a	Relatively good conditons during growing season.
<u>Western Irrigated</u>						
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	110	35	0	Fall 90 lb/a	Good stands were established. A late freeze in April delayed maturity.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Corn	80	--	--	Fall 75 lb/a	Good stands in the fall.
Western KS Farmer's Field Scott City (SC)	Scott silt loam Fallow	90	--	--	Fall 80 lb/a	Abandoned; extreme variability.

Objectives

The objectives of the National Winter Canola Variety Trial (NWCVT) are to evaluate the performance of released and experimental varieties, determine where these varieties are best adapted, and increase visibility of winter canola across the nation. Breeders, marketers, and producers use data collected from the trials. In the past decade, the number of environments and entries tested have increased. The NWCVT is planted at locations in the Great Plains, Midwest, northern U.S., and Southeast.

Procedures

Seed for the NWCVT was distributed to 40 cooperators in 22 states for the 2012-2013 growing season. Of the 50 entries, 24 are commercially available and 26 are experimental. These entries were provided by 11 global seed suppliers. All entries in the trial were treated with either Helix XTra or Prosper FX seed treatments to control insects and diseases through the late fall and early winter months.

All trials were planted in small research plots (150 ft^2) with three replications. Cultural practices, site descriptions, growing conditions, and performance data are provided for each harvested location. Yield results for some locations include 2-year summaries. Results are listed alphabetically by seed supplier.

2012-2013 Growing Conditions

Temperature and precipitation data are shown at the top of the page for each location. Thick black lines on the temperature graphs represent long-term average high and low temperatures ($^{\circ}\text{F}$) for the location. The upper thin line represents actual daily high temperatures, and the lower thin line represents actual daily low temperatures. On the precipitation graph, the line labeled "normal" represents long-term average precipitation, and the line labeled "12-13" represents actual precipitation. If weather data were not provided, they were taken from a nearby town.

In general, the 2012-2013 growing season saw above-normal temperatures and normal to below-normal precipitation. Several rounds of late spring freezes reduced plant height and delayed the crop at some locations. A cooler than normal May provided ideal conditions for grain fill and resulted in high test weights.

Test Sites and Results

Of the seven NWCVT sites planted in Kansas, four were harvested. Three trials are included in this report: Andale, Belleville, and Hutchinson. Garden City was harvested but suffered winterkill, multiple late spring freezes, and severe hail. Kiowa did not establish because of dry soils last fall. Manhattan was not harvested because of

variability in plant stands. Yield potential was reduced at Marquette because of an early fall freeze and a slow warm up in the spring.

The “percentage of test average” yield calculation is included in this year’s results. This relative yield calculation allows for some comparison of performance across environments. Entries yielding more than 100 percent of the test average across multiple locations merit some consideration.

Overall, yields were above average where moisture was not limited at planting. All sites averaged over 2,000 lb/acre. Belleville’s two-year average is 3,500 lb/acre. Hutchinson recovered extremely well from the late spring freezes. Canola weighs 50 lb/bushel, so a 2,000 lb/acre yield is 40 bushels/acre.

Variety Selection

Winter hardiness is an important trait to consider when selecting a winter canola variety. This trait has been improved over the past several years, but variability still exists where differential winterkill occurs. Winter canola varieties should show consistent survival across multiple years and locations. Other traits to consider include herbicide resistance, tolerance to carryover from sulfonylurea herbicides, maturity, disease tolerance, and yield potential. Use more than one year of data to make an informed variety selection decision.

Some sites include High Erucic Acid Rapeseed (HEAR). By definition, HEAR is not canola because it produces greater than 2% erucic acid in the processed oil. The harvested seed cannot be mixed with canola

seed, and the oil can be used for industrial purposes only. If HEAR is commercially grown, it will be under contract and a delivery point must be identified before planting. View Table 1 for seed sources, brand names, and traits of the winter canola varieties and hybrids grown in the NWCVT.

Acknowledgments

This work was funded in part by the Supplemental and Alternative Crops Competitive Grants Program, which is administered by the U. S. Department of Agriculture-National Institute of Food and Agriculture, and the Kansas Agricultural Experiment Station. Assistant scientist Scott Dooley and student workers Emma Gantz, Jessica Martin, and Baylee Showalter assisted with organizing, packaging, planting, harvesting, and data collection. Sincere appreciation is expressed to all participating researchers and seed suppliers who have a vested interest in expanding winter canola acres and increasing production in the USA.

Andale, Kansas

Brent Gruenbacher and Mike Patry

Planted: 9/18/2012 at 5 lb/a in 9-in. rows
 Swathed: 6/13/2013
 Harvested: 6/22/2012
 Irrigation: None
 Soil Test: NA
 Soil Type: Blanket silt loam
 Elevation: 1393 ft Latitude: 37° 47'N
 Comments: Spotty stands caused by fallow sorghum residue. The canola compensated well and produced exceptional yields.

Excerpts from the
University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1090, '2013 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, www.agronomy.ksu.edu/kscpt, for details. Endorsement or recommendation by Kansas State University is not implied."

Contributors

Main Station, Manhattan

Jane Lingenfelser, Assistant Agronomist (Senior Author)
Bill Bockus, Plant Pathologist
Erick DeWolf, Extension Plant Pathologist
Allan Fritz, Wheat Breeder
Mary Knapp, Weather Data Librarian
Jeff Whitworth, Extension Entomologist
