Cost-Return Projections

Cost-return projections provide estimated costs and returns for forward farm planning. They are crop and region-of-Kansas specific. Production costs for individual farmers will vary considerably due to the amounts of fertilizer and chemicals applied, the type and amount of farm machinery owned, and land costs.

Yield Level

Cost per ton and net returns in crop production are highly dependent on yields. The following estimated budget includes three different yield levels. The three yield levels are intended to represent expected yields of varying land quality for a given level of management. The timing of when alfalfa is cut as well as the timeliness of harvest and removal of hay will affect total yield and hay quality levels. Land values, government payments, and various inputs vary as yield levels vary. Crop insurance was not included in the budget as an input expense because alfalfa is typically not insured.

Variable and Fixed Costs

Table 1 shows some of the assumptions used to develop this budget. Note the lime amount assumes that 1 ton of ECC is applied every 4 years. See MF-942, *Cost-Return Budgets—Nonirrigated Crops*, for herbicide and insecticide usage.

Variable costs, such as labor, fertilizer, repairs, and fuel-oil, are costs that vary with the level of production. Labor requirements include time for management and marketing, whether operator or hired labor. Interest on variable costs is estimated by using one-half of the accumulated variable costs for the year. The cost of seed and the fertilizer used to establish the alfalfa stand are spread over 4 years.

Fixed costs do not vary with the level of production and are incurred by virtue of owning assets such as land and machinery. Machinery investment was estimated for an average-sized farm to meet planting and harvesting requirements. Salvage value of machinery was assumed to be 20 percent of the initial investment. Interest on machinery was calculated on one-half the average investment [(initial investment + salvage value)÷2]. Land costs are based on owned land. If the land is cash rented, the cost of rent per

acre should be listed on line 18 and no taxes or interest shown on lines 16 and 17. If land is rented on a cropshare basis, rent is reflected in the yield.

Profit and Return Factors

Net return on investment is the percentage return on investment. This measure enables comparisons to be made among other enterprises and investment alternatives. If the land market is efficient, the return on investment for land of varying qualities should be approximately equal. If the return on investment from lower quality land is low relative to the returns on investment from land of higher quality, this is a signal that the land is overpriced relative to better quality land.

Table 1. Factors Used for Cost-Return Budget

Item	Yield Level (ton)			
	3.0	3.5	3.9	
Fertilizer:*				
N (Anhy.)	0	0	0	\$0.15/lb
N (Dry)	0	0	0	\$0.24/lb
P	50	57	65	\$0.18/lb
K	0	0	0	\$0.14/lb
Lime	500	500	500	\$0.01/lb
Seed, lbs.**	15.0	15.0	15.0	
Seed price, \$/lb.	\$2.810	\$2.810	\$2.810	
Labor hours	4.19	4.65	5.12	
Labor price/hour				\$10.80
Land value/acre	\$645	\$806	\$967	
Land interest rate				6.00%
Land real estate tax rate				0.50%
Machinery investment				\$211
Machinery life				10 yrs
Salvage value				20.00%
Interest rate on machinery				10.00%
Insurance rate on machinery				0.25%
Interest on variable costs				10.00%

*An additional 20 pounds of nitrogen and 40 pounds of phosphate applied at seeding time prorated over 4 years.

**Prorated over 4 years.
