No-Till Farming

Moisture conservation is the primary goal of reduced tillage programs. When herbicides are used in place of conventional tillage practices, weeds that deplete soil moisture are eliminated. Crop residue remains standing, which reduces moisture evaporation from the soil surface and increases moisture captured from snowfall. Additional benefits of no-till farming over conventional tillage include increased erosion control, energy conservation, and reduced labor requirements. There is much research that confirms many of those claimed benefits. Crop residue requirements for conservation compliance are met more easily under no-till practices.

Effects of No-till on Cost Structure

Since weed control is achieved by herbicide use in no-till systems rather than with tillage, there is a shift among variable costs detailed in the following estimated crop budget. Herbicide costs increase markedly from a conventional tillage system, but fuel expense, labor, and equipment repairs decrease. The move from conventional tillage to no-till will alter machinery investment with the diminished need for tillage equipment offset by the increased need for spraying equipment.

Yield Goals

Cost per bushel and net returns in crop production are highly dependent on yields. The following estimated budget includes three different yield levels. Yield goals vary for a number of reasons such as soil type or land quality, historical weather patterns, input levels, and management. Budgeting for alternative yield goals can help producers examine the financial risk of a crop enterprise that is directly related to production risk as well as to compare the profitability of crop enterprises on farmland tracts with varying yield potentials. Multi-peril crop insurance expenses are included in western Kansas crop budgets as a cost of managing production risk in an area prone to great yield variability. Land values are not adjusted for alternative

yield goals in this budget. In customizing this budget to fit your farm, attention should be given to using land values representative of your farm's productive capacity.

Profit and Return Factors

Projections of net percentage return on investment permit comparisons to be made among alternative enterprises and other investments. Asset turnover is the ratio of gross revenue to total investment in fixed assets. This financial measure represents the efficiency of capital use.

Land interest rate				6.00%
Land real estate tax rate				0.50%
Machinery investment**				\$188
Machinery life				10 yrs
Salvage value				35.00%
Interest rate on machinery				10.00%
Insurance rate on machinery				0.25%
Interest on variable costs				10.00%

*All land costs were computed and then multiplied by a factor of 1.5 to account for fallow land (two crops every three years).

**Investment required per crop and fallow acres.
