Irrigated confectionary and oil-type sunflower production are similar in many respects to irrigated grain sorghum production in terms of tillage, fertilization and water requirements. The sunflower moth is a problem in sunflower production, but can be managed or controlled by attention to planting dates and timely pesticide application. Kansas ranked third in the nation in sunflower production during 1997.

Cost Return Projections

Any land preparation costs are included with the land charge. Other investments are shown in Table 1. Price of the energy source and Total Dynamic Head are the important factors affecting pumping costs. For instance, with 500 feet of TDH, \$1 change in gas price results in \$14.83 change in costs for each acre foot of water pumped.

The choice of a flood or center pivot system depends on: (1) available capital; (2) labor available during the growing season; (3) the terrain, which may require a center pivot system; and (4) soil type. Capital requirements will run \$20,000 to \$40,000 higher for sprinkler over flood. However, labor requirements can be as much as 1 hour per acre less for the sprinkler system. MF-836, *Irrigation Capital Requirements and Energy Costs*, shows the irrigation costs and energy input amounts used in this budget.

Yield Goals, Return Factors

Cost per cwt and net returns in crop production are highly dependent on yields. The following estimated budget includes three different yield levels. Yield goals vary for a number of reasons such as soil type/land quality, historical weather patterns, input levels, and management. Budgeting for alternative yield goals can help producers compare the profitability of crop enterprises on farmland tracts with varying yield potentials.

Multi-peril crop insurance expenses at a 65 percent yield level are included in this budget as a cost of managing production risk in an area prone to great yield variability. Land values have been adjusted for alternative yield goals in this budget. In customizing this budget to fit your farm,

attention should be given to using land values representative of your farm's productive capacity. Projections of net percentage return on investment permit comparisons to be made among alternative enterprises or other investments.
