Executive Summary

The Kansas Self-Sufficiency Report for 2004 estimates the household expenses incurred and earned income needed for particular households with children to remain independent of publicly and privately funded sources of cash, goods, and services. The report estimates household expenditures related to housing, food, child care, transportation, health and dental insurance, miscellaneous expenses, and federal and state earned income taxes.

There are several important differences in this report compared to the 2000 self-sufficiency report. First, 2004 estimates for health and dental insurance expenditures replace the 2000 category “Medical Care Expenditures.” Second, estimates for child care expenditures are based on 2004 county level data rather than the regional data used in 2000. Third, transportation costs are based on estimates of work-related driving expenditures in 2004 rather than the total household “Transportation Expenditure” estimates used in 2000. Fourth, the 2004 report includes the category of “Bedrooms” because the gender and age mix of children in households may dictate the need for an additional bedroom with its additional housing expenditure. Finally, the 2004 report does not include expenditure estimates for single-adult households that were included in the 2000 report.

The methodology used in constructing the estimates included in this report was guided by a conservative approach to household expenditures. For instance, the estimated child care expenditure relied on the lowest average child care rate available in each county; transportation expenditures were estimated for work travel only and excluded recreational travel; and, medical insurance expenditure estimates were based on health insurance policies with \$1,000 deductibles. The report also assumes that earned income is the only source of income available to the households and assumes that the households take the standard deductions for federal and state income tax purposes.

Anderson County is among the least expensive counties in which to live in 2004 and Johnson County is the most expensive county in which to live in 2004. Generally, the 2004 estimated expenditures for a single adult with an infant household are very similar to those estimated expenditures in 2000 in these counties. Estimated expenditures for single adult households with an infant and a preschool-age child are slightly lower for 2004 in Anderson County and about 5% higher in Johnson County. The general finding on other household types is that estimated expenditures increased from 8% to 24% between 2000 and 2004 in Anderson County, and from 12% to 23% between 2000 and 2004 in Johnson County.

The methods used to estimate costs for housing and food remain unchanged from the 2000 report. Across all counties there has been an increase in the cost of both of these items of household expenditure. The method for estimating transportation expenditures has been revised for 2004, taking into account only work-related transportation expenses. The result has been a slightly downward modification of transportation expenses for eight of the nine household types. The “two-adult household with two wage earners” had a more significant decline in transportation

expenditures from 2000. Medical care has been revised to include estimates for health and dental insurance, and the result has been a substantial increase in that area of household expenditure. Child care expenditures have declined on average from 2000 to 2004, but this is largely due to more accurate, though conservative, estimates of county-level child care costs. There has been a significant reduction in the tax burden on the nine types of households. That tax reduction for the various households ranges from \$150 to about \$250 per month from 2000 (1999 tax year) to 2004 (2003 tax year).

The following table presents the hourly wage range from low to high needed to meet the self-sufficiency requirements (and bedroom needs) of the various households across the 105 counties in Kansas.

Table ES 1. Hourly Wage Range From Low to High by Household Type and Bedroom Requirements Across Kansas Counties: April 2004 (in dollars)

	<u>Low</u>	<u>High</u>
Adult and infant (1 BR)	8.19	13.36
Adult, infant and preschool-age child (2-BR)	11.21	20.22
Adult, preschool-age child, and school-age child (2-BR)	10.99	17.59
Adult, preschool-age child, and school-age child (3-BR)	11.99	20.26
Adult, school-age child and teenage child (2-BR)	9.33	12.71
Adult, school-age child and teenage child (3-BR)	10.33	17.07
Adult, infant, preschool-age child, and school-age child (2-BR)	14.59	24.19
Adult, infant, preschool-age child, and school-age child (3-BR)	16.05	26.76
Two adults, preschool-age child, and school-age child (3-BR)	15.77	22.65

Chapter Six presents the county-level estimated number of one- and two-adult households, with children under the age of 18 years, that fall below the self-sufficiency standard for that county. The “low” estimate represents the conservative estimate, and the “high” estimate represents 110% of the “low” estimate. Statewide the number of households in this category is estimated to be between 101,000 and 111,000. The estimate suggests that, statewide, somewhere between 27% and 30% of all such households fall below the self-sufficiency standard of their county of residence. The percentage of such households within counties range from a low of about 14% to a high of about 50%.

Chapter 1

The Kansas Self-Sufficiency Standard Project

The Kansas Self-Sufficiency Standard Project is an effort to provide guidelines for basic household earned income levels. This project focuses on households with children and has as its central objective the estimation of the amount of earned income necessary to assure a household's total independence from all public and private subsidies. There are estimates for nine types of households in each of the 105 counties in Kansas. This project evolved from the work of Gibbons *et al.* (1996), Gibbons, Bratsberg and Bloomquist (2000), Pearce and Brooks (1997), and Bernstein, Brocht and Spade-Aguilar (2000).

The project estimates the earned income necessary to meet household needs in several categories of household consumption:

- Housing (including utilities)
- Food (including sales tax)
- Transportation
- Child care
- Health and Dental Insurance
- Miscellaneous expenses
- Taxes (Federal, state, and local excluding taxes paid on food purchases)

These categories represent the major expenditures for a household. The number and ages of household members as well as the geographic location of the household dramatically affect these expenditures. A single, statewide standard based on household size, such as the Federal Poverty Threshold, misses important differences in households, such as the ages and genders of children, that have vital implications for the cost of housing, food, and child care. Providing a measure of needed household income to achieve self-sufficiency that takes into account the details of household membership and a household's location, makes it possible to determine the necessary monthly earning (and hourly wage) that are required for different households in Kansas to achieve self-sufficiency.

The project estimates the level of income needed for selected household types to become independent of any public subsidy (such as Temporary Assistance to Needy Families, subsidized housing, utilities assistance, food stamps, subsidized child care, Medicaid, or CHIP) or a private subsidy (such as child care provided by a relative or friend, local food bank assistance, or shared housing). The Kansas Self-Sufficiency Standard reported here may provide policymakers and service providers essential information about the levels of household earned income necessary to achieve independence. At another level, the Self-Sufficiency Standard illustrates the effects of such items of consumption as child care and health insurance on the income needed to achieve self-sufficiency, and demonstrates the

potential impact of subsidizing such costs on the ability of households to reach the goal of “proximate independence.” This effect is certainly more dramatic in households with children younger than school age than in households with school age children.

The Self-Sufficiency Standard basis is the costs of household needs taking into account households’ variations in composition, ages, genders of children, and geographic location. The values used to estimate the standard are obtained from federal and state data sources, i.e., the U.S. Bureau of the Census, U.S. Department of Housing and Urban Development, U.S. Department of Agriculture, the Kansas Association of Child Care Resources and Referral Agencies Annual Survey of Child Care Costs, and the Consumer Price Index. From these sources, the Self-Sufficiency Standard estimates the income necessary for households to meet their basic needs. Households whose incomes fall below this standard have inadequate income for independence. It is not clear that this standard is definitive. It is more likely that there is some variation around the standard, even within the same geographic region. It is also likely that the standard will tend to be at the low end of this range of variation due to the use of a conservative bias in the estimates of household expenditures. The derivation of these estimates is discussed at length in the following chapter.

The Self-Sufficiency Standard assumes that all adults in a household are full-time employees, so it is necessary to include costs associated with employment, i.e., transportation, child care, and taxes. In the area of taxes, the standard includes both the “costs” (state sales taxes, payroll taxes, and federal and state income taxes) and the “benefits” (Child Care Tax Credit, Child Tax Credit, Additional Child Tax Credit, and Earned Income Tax Credit). The tax benefit, when it occurs, will appear as a negative (-) number in the tables to indicate that it reduces the household income necessary to achieve self-sufficiency.

Table 1.1 presents the state average for the nine different household types included in the 2004 study with county estimates weighted by the population in each county. The number of adults and number and ages of children generally define the household composition. Three different households appear twice in the table because the number, ages, and genders of the children in the household might necessitate an additional bedroom in the household. The one household with two adults is assumed to require three bedrooms. The “household type” designations are included to facilitate comparison with estimates from the 2000 study reported in Table 1.2.

Comment [MSOffice2]: Should this description include children?

Chapter 2

The Kansas Self-Sufficiency Standard

This chapter describes the calculation of the Self-Sufficiency Standard for full-time wage earners in Kansas. The Self-Sufficiency Standard is the amount of income required to meet basic needs in the Kansas marketplace without the assistance of public and private subsidies. The standard therefore excludes public subsidies such as public housing, food stamps, Medicaid, and child care benefits, but includes tax benefits such as the Child Tax Credit, Child Care Tax Credit, and the Earned Income Tax Credit. The standard also ignores private/informal assistance such as free child care by relatives or friends, food from local food banks, money from family, and housing shared with family or friends.

The Self-Sufficiency Standard is calculated from monthly expenditures on six consumption categories: housing, child care, food, transportation, health and dental insurance, and miscellaneous consumption. In addition, the standard accounts for the sales taxes and income taxes faced by consumers and wage earners. Below we list assumptions and data sources for each of the standard's components.

To account for the variation of consumption expenditures across family types, we calculate the Self-Sufficiency Standard for each of nine types of households. Eight of the household types assume a single-parent household and the following combinations of children and bedrooms: (1) one infant with one bedroom, (2) one infant and one preschooler with two bedrooms, (3) one preschooler and one school-age child with two bedrooms, (4) one preschooler and one school-age child with three bedrooms, (5) one school-age child and one teenager with two bedrooms, (6) one school-age child and one teenager with three bedrooms, (7) one infant, one preschooler, and one school-age child with two bedrooms, (8) one infant, one preschooler, and one school-age child with three bedrooms. We focus on single-parent households because the initial request to estimate sufficiency standards was for clients of the Kansas Temporary Assistance For Needy Families (TANF) program, the vast majority of whom are single-parent households. We do, however, include a ninth household type consisting of a married couple with two children (one preschooler, and one school-age child), with three bedrooms. It is assumed that both adults in this household are employed full-time.

Comparison of the monthly earnings required for the ninth household type with the fourth (which is a single-parent household with the same number and age of children) reveals an additional \$567.18 difference (see Table 2.1). A similar difference could be expected for married couples with the same number and age of children as the remaining household types, assuming both parents are working full-time. The total monthly earnings required for a household would of course be the sum of what they earn on their respective jobs.

Married couples with only one spouse working outside the home could reduce the total monthly earnings required (which would include the \$567.18 required to meet the second adult's basic needs) by the other spouse providing child care. As will become evident, the amount of the reduction would vary considerably across the number and age of children and county.

This section reports the Self-Sufficiency Standard for typical families in Kansas, showing expenditures of families facing average consumption costs for the state. Whenever costs differ by county, we compute the state average by weighting regional costs by the population share of each county. (Population weights are computed from county-level population estimates for 2003; these data are drawn from the U.S. Bureau of Census (2004)). Because the residential pattern of the Kansas population is weighted toward counties in which costs are higher, this procedure makes the state-level standard higher than a simple, unweighted average across counties. There are considerable differences in some cost items (e.g., child care) across counties. Chapter 3 accounts for such differences and reports the self-sufficiency standard for each of the 105 counties of the state.

The Self-Sufficiency Standard reflects prices of consumption items as of March, April, and May 2004. Whenever the standard draws on data from older sources, the values have been updated to April 2004 using the Consumer Price Index (CPI).

2.1. Assumptions and Data Sources

Housing: Housing costs are from the April 2004 Fair Market Rents tables for Kansas issued by the U.S. Department of Housing and Urban Development (HUD). The Housing Act of 1937 requires HUD to publish fair market rents annually, and their rent tables are widely used by federal and state agencies. The fair market rents reflect costs of shelter rent and utilities (except phone) at the 40th percentile of the distribution of cost of rental housing for each non-metropolitan county and at the 50th percentile for each metropolitan county. This distinction is due to higher competition for housing in metropolitan areas than in non-metropolitan areas. HUD bases estimates on data from three sources: the 2000 Census, the American Housing Surveys conducted in-between census years, and random phone surveys from individual housing markets. The underlying distribution of rent covers recent movers into existing housing; excluded from the analyses are renters with tenures exceeding 15 months and those living in new housing units less than two years old.

In deriving the Self-Sufficiency Standard, we assume that the family rents a two-bedroom (family type designation "A") or three-bedroom (family type designation "B") dwelling, except for the "adult with an infant" family type that we assume requires a one-bedroom dwelling. Morris and Winter (1978) summarize the generally accepted guidelines for bedroom allocation based on age and gender of children.

1. One bedroom is required for the head or heads of household. Infants and small children are allowed to share the parental bedroom.

2. A separate bedroom is required for each additional unmarried adult and for each additional couple.
3. Two children of either gender under the age of six may share a bedroom.
4. A bedroom may be shared by two children of the same gender above the age of six, provided the age difference is not greater than four years.

Child Care: The self-sufficiency estimate assumes that households rely on purchased child-care services. Full-time care of 45 hours per week for 52 weeks is required for children not in school. For school-aged children under the age of 13, part-time care of 20 hours per week is required for 36 weeks of the year, and full-time care of 45 hours per week is required for 16 weeks of the year. The cost of child care for school-aged children under 13 years of age is averaged over the whole year in the manner of a “level payment plan” to avoid reporting different “in school” and “out-of-school” self-sufficiency rates for households.

Child-care costs come from the Kansas Association of Child Care Resource and Referral Agencies (KACCRRRA) 2004 annual survey of child care providers. This survey reports the average hourly rate for child care by type of provider, age group of children in months, and part- or full-time utilization and county for April 2004. Provider types are grouped into two categories: (1) child care centers and (2) licensed, registered, and group homes. There are three age groups of children: (1) zero to 17 months, (2) 18 to 59 months, and (3) 60 or more months. Full-time child care is 45 or more hours per week. Part-time child care is less than 45 hours per week. The data from this survey is reported with the permission of KACCRRRA in Chapter 5.

The self-sufficiency estimates rely on the lowest average child care rate by age group of the child and part- or full-time care status in each county. This approach is consistent with the effort to produce conservative self-sufficiency estimates. It also represents a considerable improvement over the child care expenditure estimates used in the 2000 report on household self-sufficiency (Gibbons, Bratsberg and Bloomquist) because data are available for each county. The 2000 report relied on data grouped into SRS administrative regions and the values used were averages across numerous counties resulting in estimates that were either too high or too low in any particular county.

Finally, it is important to note that not all families will have access to the lowest average child care rate due to the lack of available child care slots, or the need for more expensive services based on the special needs of children, or to distance. By the same token, some families will have access to child care services that are lower than the average rate. Many questions remain unanswered about how households meet their child care needs so the construction of precise estimates in this category of household consumption remains in question.

Food: The Self-Sufficiency Standard bases food costs on the April 2004 low-cost food plan from the U.S. Department of Agriculture (USDA). The 1996 study by Gibbons

et al. found that the USDA low-cost food plan closely resembled both food expenditures of low-income households in Kansas and the subsistence food plans developed from nutritionally adequate food plans using Kansas prices of food items. By comparison, the 1996 study concluded that the thrifty food plan—which forms the basis for official poverty thresholds—severely understated food expenditures of households in the state.

Transportation: Estimating transportation costs for Kansas households in 2004 has improved over the estimates for 1999. For the 1999 report, the self-sufficiency standard assumed monthly transportation expenses of \$193 for single-adult households and \$386 for two-adult households without regard to geographic location. These values were based on survey research of Kansas households that did not permit differentiation based on geographic location. These estimates were for transportation to work only. Perhaps somewhat conservatively, the estimates ignored any costs associated with transporting children to and from child care.

The work of Bernstein, Brocht, and Spade-Aguilar (2000) suggests an alternative method for calculating transportation costs. Their recommended approach to calculating transportation expenses for households is as follows.

...we recommend using the total miles driven by MSA size...multiplied by the IRS cost-per-mile-rate...We recommend including a percentage for non-work-related transportation costs, such as shopping, family/personal business, and trips to school and church. According to the National Personal Transportation Survey, in 1995 31% of miles traveled were for social or recreational purposes...In order to exclude transportation costs for social or recreational purposes, we recommend including 69% of total transportation costs in the budget for single-parent families. In two-parent families, only transportation costs for work trips (28%) should be included for the second adult (p. 31).

The authors' reliance on MSA (Metropolitan Statistical Area) size works well for obtaining data on urban areas, but similar data are not available for rural areas. Beyond this limitation, the recommended approach seems reasonable. [Note: Since the data for this report were originally collected and computations were made, a more recent report of the NPTS (2001) came available that indicates social and recreational travel, as a percentage of all travel, has declined to 28%. Thus, the travel expense estimates for this report are slightly lower than they would be with this new information.]

In order to address the lack of data for non-MSA miles driven, an assumption was made that householders would drive more miles as the "ruralness" of their household location increased. The county population estimates for 2002 are the indicators of "ruralness." The ten most populated counties became Group VI and were assigned 9,000

miles per vehicle annually. The use of 9,000 miles for the most populated counties is based on an estimated average of slightly less than 9,000 miles per year for MSAs from the NPTS. The ten least populated counties became Group I and were assigned 14,000 miles per vehicle annually. The remaining counties were distributed into the four in-between groups with 10,000, 11,000, 12,000, and 13,000 miles respectively per vehicle annually. The assumption that guided the distribution of counties into these six groups was that the annual miles driven would be normally distributed. The result of the distribution is that the county average annual miles driven is about 11,500 per vehicle with a skewness of 0.010 (perfectly normal skewness is 0.0) and a kurtosis of -.792 (perfectly normal kurtosis is -1.0). It certainly could be argued that the average driving miles assigned to each of these groups is too low, but the intent of the authors of this report is to remain on the conservative side of estimates. The importance of this approach is that it does provide for addressing the geographical location element as a factor in the transportation expenses of households. (See Appendix A for the county data level data.)

Finally, transportation costs for each household are estimated from 69% of the miles driven and multiplying that result by IRS allowance of 36 cents-per-mile. In the household with two adults, the transportation expenses associated with the second vehicle uses 28% of the miles driven instead of 69%, and this is added to the expense calculated for the first vehicle.

Health Insurance: The Self-Sufficiency Standard reported here assumes that households purchase health insurance through available providers. The insurance purchased includes \$1,000 deductible and no deductible for prescription drugs. It also provides a co-pay for office visits of 20% after the deductible is met (\$25 per office visit when such coverage is available). These choices represent a balance between lower deductibles with higher monthly cost and higher deductibles with lower monthly cost. These choices are also consistent with efforts to be conservative on estimates of items of household expenditure for this report. The data for each county in Kansas are from the web site <https://www.ehealthinsurance.com>. This website provides a list of health and dental insurance policies (see next section) based on ZIP code and household composition.

The insurance plans identified for Kansas families are PPOs (preferred provider organizations). According to a recent Washington Post article (Albert Crenshaw, "Health Insurance Premiums See Double-Digit Increase," September 9, 2004), PPOs are the most common type of plan and cover 55% of workers who have healthcare. They are also slightly more expensive than health insurance through health maintenance organizations (HMOs). According to the article, the average worker pays about 30% of the cost of healthcare insurance provided through an employer, or about \$2,661 annually (\$222 monthly) for family coverage. While 61% of all workers have some form of health insurance through their employers, only 50% of workers in small firms (3 to 199 workers) have such coverage. It should also be noted that employer-based group health insurance provides better coverage than could be obtained by a family paying the equivalent of the worker share reported above.

The health insurance costs in this report represent the best available data across all Kansas counties. The report tends to overestimate costs for families with group health insurance through an employer and underestimate costs for families with lower deductible health insurance. There is concern that a health insurance policy with a \$1,000 deductible might work a hardship on a household at the threshold of self-sufficiency, the higher cost of the lower deductible more than offsets that hardship. The choice of the \$1,000 deductible policy rather than the \$500 deductible policy is based on the considerably higher monthly cost for the lower deductible policy that more than offsets the higher deductible. For instance, in Riley County the annual premium difference for a mother and one child is an additional \$1,080 for the lower deductible policy and nearly an additional \$2,000 annually for a family with two adults and two children.

The self-sufficiency estimates in this report do not provide for out-of-pocket household expenditures related to healthcare. Due to lack of adequate data to estimate this cost for the various Kansas households identified in this report, we have assumed such expenditures are included in the Miscellaneous Consumption category.

Dental Insurance: Dental insurance is included in the self-sufficiency estimates as a separate item. It is not included in health insurance purchased privately, but may be included in group health insurance provided through an employer. It was deemed important to include dental insurance in the self-sufficiency estimates because of the importance of dental care for children, and the evidence that only one of five uninsured receive dental care (Medical Expenditure Panel Survey, 2000).

The data for the cost of dental insurance are obtained from the same source as that used for health insurance. It provides the best estimate for all Kansas counties for the cost of dental insurance and is sensitive to family composition and ages of household members. It also provides for selecting the least expensive dental insurance provider. The dental plans generally have limited coverage and high deductibles for services from non-PPO member dentists. The deductibles range from 30% to 80%, depending on the procedure, and generally have an annual maximum of approximately \$750 per person.

Miscellaneous Consumption: Following Pearce and Brooks (1997), the standard includes expenditures on consumption items such as clothing, phone, household supplies, etc., equaling 10% of all other costs. As noted above, we assume out-of-pocket medical costs are included in this category. A related assumption is that households facing medical costs not covered by their insurance policy would have to cut back on their expenditures for the items listed above.

Taxes: The Self-Sufficiency Standard accounts for the taxes that Kansas households pay. Taxes include Federal Insurance Contributions Act (FICA) taxes, and federal and state income taxes. Sales taxes are not included because only food and some miscellaneous consumption items would be subject to sales taxes and they are included in

the total expenditures for each of these categories of basic needs. The FICA taxes are computed as 7.65% of wage income. Federal income taxes are based on the wage income of the household unit but account for the following tax credits where applicable: Child Care Expense Credit, Child Tax Credit, Earned Income Tax Credit, and Additional Child Tax Credit. Similarly, Kansas income taxes are computed from wage income and include tax credits for child care, earned income, and Kansas food sales taxes.

2.2 The State Self-Sufficiency Income

Table 2.1 lists the estimated expenditures needed by nine household types for each expenditure category and the income required for them to be self-sufficient in covering the total expenditures. The estimates are state-level averages for household type. Monthly self-sufficiency income ranges from \$1,726 for a single adult with an infant child to \$3,600 for a single adult with three children. The hourly self-sufficiency wage, which assumes full-time employment (40 hours a week, 50 weeks per year), ranges from \$10.36 to \$21.60.

The expenditure line in this table reflects the impact, if any, of tax refunds for the monthly expenditure of average Kansas households at the self-sufficiency threshold. The amount on this line may be higher than the amount on the monthly earnings line due to tax refunds. Tax refunds appear as those values on the total taxes line that have a minus (-) sign in front of them. Some of these household types have average monthly earnings less than their expenditures. Thus the tax refund has the effect of reducing the earnings necessary for the household to reach the self-sufficiency threshold for its household type.

Table 2.2 presents the consumption categories as percentages of the average, total household expenditure for the nine types of Kansas households. The expenditure item is reported as a percentage of earnings. The values total to 100%, except in those instances where a household has a tax refund rather than a tax liability (as indicated by a minus (-) sign). The refund is not assigned to any other expenditure category. It effectively reduces the amount of earnings needed by a household to meet its expenses. Thus, the household self-sufficiency expenditures actually exceed the self-sufficiency earnings in those households.

¹ Minus (-) sign means this percentage of earned income received as a tax refund.

2.3 Calculating Taxes

Tables 2.4 (Johnson County) and 2.3 (Anderson County) are presented to illustrate the computations of taxes underlying the self-sufficiency standard using the federal and state tax procedures for the 2003 tax year. These two counties are, respectively, the most expensive and least expensive self-sufficiency income counties in Kansas. The taxes reported in these two tables are based on the annual earnings and child care expenditures for households in these counties. Tables for all Kansas counties are in Chapters 3 (annual) and 4 (monthly).

Federal Income Taxes: Tables 2.3 and 2.4 report the earned income for each household type on the top line. This amount is the adjusted gross income (AGI) for tax purposes. The second line reports the FICA (Social Security taxes) for each household. This is a separate item of household expense that all wage earners must pay, amounting to 7.65% of one's annual wage income. The third line of the tables reports the deduction/exemptions for each household under the assumption that a household takes the standard deduction (i.e., they do not itemize). The fourth line reports the taxable income derived by subtracting the deduction/exemptions from the adjusted gross income (earned income in these cases). The fifth line reports income taxes due on the taxable income from the line above. The amount of taxes on this line depends not only on a household's taxable income, but also on whether the household income is from a single head-of-household or a married couple filing jointly. For a single head-of-household the tax rate is 10% on taxable income up to \$9,999, and 15% on taxable income of \$10,000 or more. For a married couple filing jointly the tax rate is 10% on taxable income up to \$13,999, and 15% on taxable income over that amount. Federal tax rates increase to 25 percent for a single, head-of-household on taxable income above \$38,050, and for a married couple filing jointly the tax rate increases to 25% on taxable income above \$56,800. However, none of the households at the self-sufficiency level are in those higher taxable income brackets.

The tax code provides tax credits to working parents who incur child care expenses in order to earn a wage or salary income (line six of the tables). The amount of the child care credit depends on actual child care expenses and earned income. Child-care expenses eligible for a tax credit are limited to \$3,000 annually for one child and \$6,000 for two or more children. Depending on the level of earned income, taxpayers are allowed to deduct between 20% and 35% of child care expenses from the taxes they owe. Households with adjusted gross incomes (AGI) of \$15,000 or less may deduct 35% of cost of child care up to the allowable maximum. For each additional \$2,000 increase in AGI, the percentage of child care cost that may be deducted decreases by 1% until it reaches 20% for households with an AGI of \$43,000 or more. Households can also deduct up to \$1,000 per eligible child as the child tax credit (line seven of the tables). Both of these deductions are subtracted from the actual tax liability of the household. That is, the amount of tax credit for these two deductions cannot exceed the amount of income taxes actually owed. The net federal income taxes owed for the household types are reported on line eight. Note the federal income tax liability for households with earned incomes at the self-sufficiency level is eliminated by the combination of the child care tax credit and the child tax credit for all household types in Anderson County and all but two household types in Johnson County (see Table 2.3 and 2.4, respectively).

The tax code also allows for a tax refund intended to ease the tax burden and supplement the earnings of low-income workers—the Earned Income Tax Credit. The amount of the earned income tax credit depends on filing status and earned income. The earned income tax credit available for the household types in counties are reported in line nine of the tables. Note this credit is not available for households with earned incomes above \$30,000. The earned income tax credit is refundable to households with lower incomes, including households who owe no federal income taxes, which is the case for most of the household types in both Anderson and Johnson County. In addition, the federal tax code allows for a refundable Additional Child Tax Credit (shown in line ten of the tables). This tax credit benefits households with children by allowing a tax credit up to \$1,000 per eligible child. Eligibility for this credit is extremely complex and will not be presented here.¹

Line 11 reports the net federal income tax by household type. A minus (-) sign in front of the amount on this line indicates the tax refund a household would receive if they take the tax credits reported in lines 9 and 10. All but two of the household types in Johnson County are eligible for federal income tax refunds with earnings at the self-sufficiency level (single-parent households with a school-age child and teenager of different genders and single-parent households with three children). Some of the refunds are substantial, ranging to as high as \$4,132 for single-parent households with a school-age child and teenager of the same gender. These refunds effectively reduce the earned income a household must have to achieve self-sufficiency.

State Income Taxes: State income taxes rely on the same earned income as the federal income taxes. The Kansas code also allows for deductions/exemptions. The amounts for which the household types in the counties are eligible are reported in line 12 of the tables. Line 13 reports the taxable income each household type would use to calculate state taxes. Line 14 reports the amount of state income taxes due on the taxable income in the preceding line. Kansas allows for a child care tax credit, which is reported on line 15 of the tables. Following Kansas tax code procedures, it is derived by taking 25% of the amount allowed for the federal child care tax credit on line six. It is similar to the federal tax credit in that it can only be used to offset income taxes actually owed to the state.

Line 16 reports the total state income tax for the household types in the two counties, after subtracting the child care tax credit (line 15) from the state income tax (line 14). Kansas also allows for an earned income credit, which is 15% of the federal earned income credit (line 9). The amount available for each household type is reported in line 17. Kansas also allows for a food sales tax credit to adjust the state income taxes due for a household. The amount of credit available depends on income and household composition. The credits available to household types in the two counties are reported in line 18. Finally, line 19 reports the net state income tax owed by each household type in the two counties. As with the net federal income tax, a minus (-) sign indicates a given household type is entitled to a state

¹ Explanation of the procedures followed to determine the amount available for the household types considered here is available from the authors upon request.

Chapter 3

The Annual Data by Household Type and County

This chapter presents the annual expenditures by category of expenditure, earned income, Social Security (FICA) taxes, net federal income taxes, net state income taxes (including the Food Sales Tax Refund), and total expendable income for each type of household in each of the 105 counties in Kansas. The tables also report the hourly wage, based on 2,000 hours of wage earning work per year, required to meet the earned income necessary for the household to achieve the self-sufficiency income level.

In many instances, the earned income and the expendable income amounts are not equal. This is due to the tax transfer effect in some households. That is, some households receive a net income tax refund (appears with a minus (-) sign that reduces the amount of earned income necessary to meet household expenditures). The earned income total for a household, minus Social Security tax, minus federal and state income taxes (plus either federal or state taxes if a minus sign appears before them), equals the expendable income for the household.

The table header defines the nine household types. The household types are described here for the reader's information.

1. One adult and an infant (ONE ADULT INF) living in a one-bedroom unit (1-BR)
2. One adult, an infant and a preschooler (ONE ADULT INF PRSCH) living in a two-bedroom unit (2-BR)
3. One adult, a preschooler, and a school-age child (ONE ADULT PRSCH SCHAG) living in a two-bedroom unit (2-BR)
4. One adult, a preschooler, and a school-age child (ONE ADULT PRSCH SCHAG) living in a three-bedroom unit (3-BR)
5. One adult, a school-age child, and a teen (ONE ADULT SCHAG TEEN) living in a two-bedroom unit (2-BR)
6. One adult, a school-age child, and a teen (ONE ADULT SCHAG TEEN) living in a three-bedroom unit (3-BR)
7. One adult, an infant, a preschooler, and a school-age child (ONE ADULT INF PRSCH SCHAG) living in a two-bedroom unit (2-BR)
8. One adult, an infant, a preschooler, and a school-age child (ONE ADULT INF PRSCH SCHAG) living in a three-bedroom unit (3-BR)
9. Two adults, a preschooler, and a school-age child (TWO ADULTS PRSCH SCHAG) living in a three-bedroom unit (3_BR)

Three assumptions about the households are:

1. The one-adult households included here are assumed to be female-headed households. If a male-headed household were assumed, there would be additional allowances for food.
2. The two-adult household is assumed to be a male and female couple.
3. A distinction is made between two- and three-bedroom living units because the ages and genders of children in the household may necessitate separate bedrooms for some of those children (see prior discussion for details).

Chapter 4

The Monthly Data by Household Type and County

This chapter presents the monthly expenditures by category of expenditure, earned income, Social Security (FICA) taxes, net federal income taxes, net state income taxes (including the Food Sales Tax Refund), and total expendable income for each type of household in each of the 105 counties in Kansas. The tables also report the hourly wage, based on 2,000 hours of wage earning work per year, required to meet the earned income necessary for the household to achieve the self-sufficiency income level.

In many instances, the earned income and the expendable income amounts are not equal. This is due to the tax transfer effect in some households. That is, some households receive a net income tax refund (appears with a minus (-) sign that reduces the amount of earned income necessary to meet household expenditures). The earned income total for a household, minus Social Security tax, minus federal and state income taxes (plus either federal or state taxes if a minus sign appears before them), equals the expendable income for the household.

The table header defines the nine household types. The household types are described here for the reader's information.

10. One adult and an infant (ONE ADULT INF) living in a one-bedroom unit (1-BR)
11. One adult, an infant and a preschooler (ONE ADULT INF PRSCH) living in a two-bedroom unit (2-BR)
12. One adult, a preschooler, and a school-age child (ONE ADULT PRSCH SCHAG) living in a two-bedroom unit (2-BR)
13. One adult, a preschooler, and a school-age child (ONE ADULT PRSCH SCHAG) living in a three-bedroom unit (3-BR)
14. One adult, a school-age child, and a teen (ONE ADULT SCHAG TEEN) living in a two-bedroom unit (2-BR)
15. One adult, a school-age child, and a teen (ONE ADULT SCHAG TEEN) living in a three-bedroom unit (3-BR)
16. One adult, an infant, a preschooler, and a school-age child (ONE ADULT INF PRSCH SCHAG) living in a two-bedroom unit (2-BR)
17. One adult, an infant, a preschooler, and a school-age child (ONE ADULT INF PRSCH SCHAG) living in a three-bedroom unit (3-BR)
18. Two adults, a preschooler, and a school-age child (TWO ADULTS PRSCH SCHAG) living in a three-bedroom unit (3_BR)

Three assumptions about the households are:

1. The one-adult households included here are assumed to be female-headed households. If a male-headed household were assumed, there would be additional allowances for food).
2. The two-adult household is assumed to be a male and female couple.
3. The distinction is made between two- and three-bedroom living units because the ages and genders of children in the household may necessitate separate bedrooms for some of those children (see prior discussion for details).

Chapter 5

Additional Tables

This chapter presents various tables of additional documentation to provide more detail on the various components of household expenses.

Table 5.1 presents the county rank order on household expenditure to achieve self-sufficiency by household type from most expensive (1) to least expensive (105). It appears that Anderson County has the lowest self-sufficiency expenditures for the nine different types of households with Edward and Chautauqua counties running a close second. Johnson County remains at the top for household expenses to achieve self-sufficiency. The range of hourly wages from low to high by household types and bedrooms across counties is listed here to provide some perspective on the terms “least expensive” and “most expensive.”

	<u>Low</u>	<u>High</u>
Adult and infant (1 BR)	8.19	13.36
Adult, infant and preschool-age child (2-BR)	11.21	20.22
Adult, preschool-age child, and school-age child (2-BR)	10.99	17.59
Adult, preschool-age child, and school-age child (3-BR)	11.99	20.26
Adult, school-age child and teenage child (2-BR)	9.33	12.71
Adult, school-age child and teenage child (3-BR)	10.33	17.07
Adult, infant, preschool-age child, and school-age child (2-BR)	14.59	24.19
Adult, infant, preschool-age child, and school-age child (3-BR)	16.05	26.76
Two adults, preschool-age child, and school-age child (3-BR)	15.77	22.65

Table 5.2 presents the Food Sales Tax Refund amount by household type and county for the 2003 tax year. Eligibility for this refund is based on household income and the number of household members. The Food Sales Tax Refund is included in the Net State Income Taxes figures reported in the annual and monthly data tables in Chapters 3 and 4.

Table 5.3 reports the average hourly rate for childcare by type of provider, by age of child in months, and by part- or full-time utilization¹, and by county for April, 2004. Providers may be in the licensed, registered, or group home category, or in the child care center category. Child age categories are birth to 17 months, 18 to 59 months, and 60 months or older. Full-time care is 45 or more hours per week. At the end of this table there is a reference to a website that provides additional information.

Table 5.4 presents, by county, the 2002 population, the mileage group, and the driving miles assigned in estimating transportation expenses for the self-sufficiency study. There are six groups of counties that are, more or less, normally distributed on the driving miles measure.

Chapter 6

County Level Households with Children Under 18 Years of Age and with Income Less Than the County Self-Sufficiency Standard¹

This chapter reports estimates of the number of one- and two-adult, Kansas households with children less than 18 years of age that fell below the self-sufficiency standard for their county in April 2004. The following discussion reports the procedure used to reach the estimates, with a detailed explanation of each, and the assumptions used in the process.

6.1 Estimating the 2004 Population for Each County

The 2004 estimates for the county populations come from federal census estimates. As of 3/30/05, county level estimates were not available for 2004. Using the federal census data, we calculated the rate of change in county population estimated between 2002 and 2003 and applied it to county population estimates for 2003. The federal census does report a statewide population estimate for 2004, and it compares favorably to the aggregate of the estimated county population totals we derived from the above procedure. [Data Source: US Census Bureau. Population Estimates by County: Kansas. Available at www.census.gov/popest/counties/CO-EST2003-01.html. Accessed 3/30/05.]

6.2 Estimating the Number of Kansas Households with Children in 2004

Estimates of the number of households with children in 2004 are based on family data from the 2000 census. We first aggregate the number of (1) married couples with children, (2) single mothers with children, and (3) single fathers with children. This aggregate is divided by the total population for 2000 to produce a proportion. This proportion is multiplied by the population estimate for 2004 (Section 6.1). For instance, Allen County had 1,868 families with children in 2000 and a total population of 14,385. After dividing the two figures we obtained approximately 0.1298 which we then multiply by the county population estimate for 2004 (13,703). The result is 1,779, and that value represents the estimate of the number of families with children in Allen County in 2004. Of course, in making such estimations it is assumed that the proportion of families to total population remains constant between 2000-2004. [Data Source: Census 2000 Summary File 4 (SF 4) - Sample Data: PCT157. Poverty Status in 1999 of Families by Family Type by Presence of Related Children Under 18 Years by Age of Related Children.]

¹Derrick Cline, graduate student in sociology, assisted with the preparation of the text

and data for this chapter.

6.3 County Level Household Median Income for 2000

The 2000 county level median household income is presented only as a reference point, and these data were not a part of any estimations of the number of households falling below the county level self-sufficiency standard. These data are available from the SAIPE program of the federal census. We include the 2000 income data because we believe it is a reasonable estimate of what median incomes may be for 2004. Although estimates of median household income fell in both 2001 and 2002, CPS data suggests that the median household income has increased in 2003 and 2004 to levels commensurate with 2000. Unfortunately, census data estimates for median household income are not currently available for 2003 or 2004. Therefore, with available data, because median household incomes were at their highest in 2000 we supply these only as a point of reference. As with any median, 50% of all households fall below this income level. A significant limitation of these data is that the measure is based on income data from all households in each county, not just the households with children. We assume that change in the annual state average of median incomes is uniform throughout all counties in Kansas. In reality, however, the median income in some counties may be declining, while in others it is increasing. Finally, in presenting the 2000 median incomes, we assume that household incomes increased after 2002 to the 2000 levels. [Data Source: Small Area Income and Poverty Estimates (SAIPE), US Census Bureau, 2000 State and County Estimates. www.census.gov/hhes/www/saipe/download.html. Accessed 3.30/05.]

6.4 Estimating the Number of Households with Children Under 18 Years of Age in Each County in 2004 in Relation to Income Ratios of Federal Poverty Guidelines

Estimating the number of households with children under 18 years of age in the various categories of ratios of income to poverty was accomplished by holding the *proportion* of households in each category constant over the period 1999-2004. The basic county level data are taken from the federal census conducted in the year 2000. The income data available in that survey reflect money earned in 1999. There are five categories of income-to-poverty ratio-data on households with children under 18 years of age that are examined: below poverty, 100% of poverty to below 130% of poverty, 130% of poverty to below 150% of poverty, 150% of poverty to below 185% of poverty, and over 185% of poverty. Using 1999-2000 census data at the county level, we divided the number of households with children under 18 years of age in each of the categories by the total number of households with children under the age of 18 years, in each county. We assume that the *proportion* of households with children under the age of 18 years in each of the categories is constant from 2000 to 2004. Thus, for the estimation of 2004 households with children 2004 in each of these categories, we multiplied the 2000 *proportion* by the total number of households with children under 18 years of age

estimated to reside in each county in 2004 (Section 6.2).

This method of estimating the number of households with children under 18 years of age in each income category was used because reliable and precise income data at the county level is lacking outside of the ten-year census. The federal census bureau has several programs that produce estimates of income distribution between census years, (e.g. CPS or SAIPE), but, unfortunately, these are limited in their usefulness. The CPS provides data about the prior year in the spring of the next year. These data are a *statewide* estimation and lack substantial sample size. The SAIPE is more focused in that it includes county level estimates, but its release is somewhat delayed and 2004 data are not available until 2006. In the absence of current data, this study must rely on available data, and make reasonable assumptions to extend those data into the time-frame of the study.

The assumption about the income of households with children under 18 years of age in 2004 is that the percentage of households in each income category is the same in 2004 as it was in 1999. Therefore, whatever the income distribution is for 1999 (various categories of income to poverty ratios), we assume it is the same for the 2004 estimation. Evidence to support this assumption is that the CPS estimated a trend toward higher statewide income distribution from 1997-2000, and then a gradual decline in income distribution through 2003. If, between 2003-2004, the proportion of statewide households with children under 18 years of age in the various income ranges continued to decline at a rate of, or slightly below the rate experienced between 2002-2003, then that income distribution is very near 1999 levels. [Data Source: Census 2000 Summary File 4 (SF 4) – Sample Data: PCT162. Ratio of income in 1999 to poverty level of families by family type by presence of related children under 18 years by age.]

6.5 A Low and a High Estimate of One- and Two-Adult Households with Children Under the Age of 18 Years, Below the Self-Sufficiency Standard, for Each County

In this entire body of work, the objective has been to make conservative estimates. The estimates of self-sufficiency income are consistently conservative choices with respect to the cost of household items of expenditure. Where there are choices between higher and lower cost items, we select the lower cost items. Likewise, the estimated population below the self-sufficiency standard for each county is a conservative estimate. When there are choices about the population and household projections for these estimates, we select the lower projections.

We believe the basic estimates for households below the self-sufficiency standard for the counties are the conservative estimates. We have provided a “high” estimate for each county to add some balance to the estimates. The high estimate is 110 percent of the low estimate. We think this constructs a range within which the “true” numbers of households with children under the age of 18 years, below the self-sufficiency standard for each county, fall.

For the State of Kansas, the estimated total number of one- and two-adult householdes with children under the age of 18 years, below the county of residence self-sufficiency standard ranges from a low of 27.0 percent to a high of 29.7 of all such households in the State, or between 101,000 and 111,000 households. The percentages, within counties, for this measure range from a low of 13.9 percent to a high of 47.9 percent. The same measure for two-adult households only, ranges from a low of 9.0 percent to a high of 43.0 percent. The same measure for one-adult households only, ranges from a low of 28.0 percent to a high of 73.0 percent. These data are presented in Figures 1, 2, 3, 4 on the following pages.

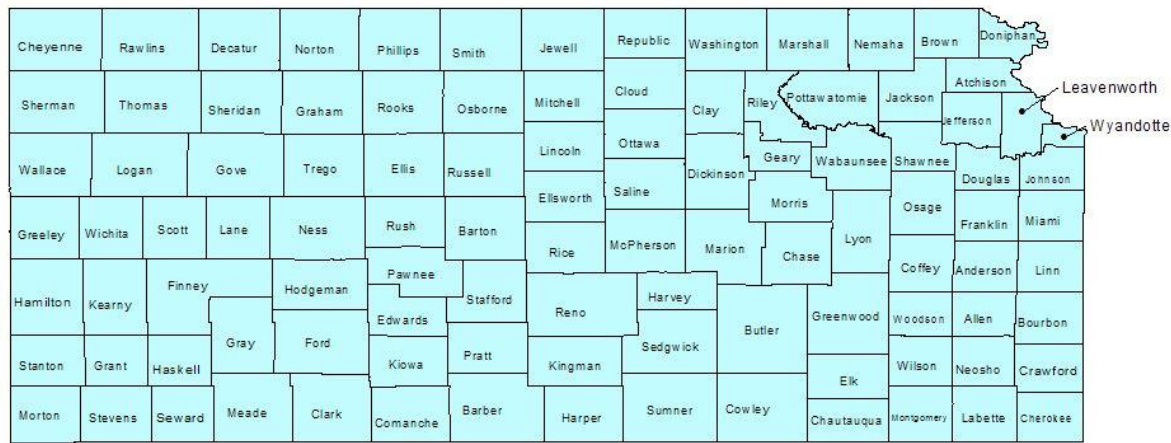

6.5 Estimates of the Number of Households with Children Under 18 Years of Age in Each County in 2004 that Fall Below the Self-Sufficiency Standard of Their County of Residence

Following the four figures, Table 6.0 presents the counties in rank order from lowest to highest percentages of their households included in the study that fell below the self-sufficiency standard. The county with the lowest rate is Johnson, and the county with the highest rate is Wichita.

Tables 6.1 to 6.105 present, for each Kansas county, the low and high, and total estimated number of households with children under the age of 18 years, by one-adult and two-adult households, and by percentage of estimated total families. These tables also present the self-sufficiency income standards for each of the different household types we have examined in this work, and the percent of poverty, by appropriate household size, that the income of each household type represents for each county. Finally, the tables present the 2000 median income for all households in the county during 2000 as a reference number.
