Major Professor

ACKNOWLEDGEMENTS

I would like to extend my thanks and deep appreciation to those persons who help make this study possible.

To Dr. John Parmley, my major advisor, for his concern, wisdom, encouragement, and support throughout this study and during my graduate work in Agricultural Education.

To my fellow graduate students and Adult and Occupational faculty and staff, for their assistance, support, and friendship.

To Dr. Richard F. Welton, for his never ending faith in my ability, and his support during my undergraduate and graduate work in Agricultural Education.

To Dr. Mary Evan Griffith, Dr. Parmley, Marvin Hachmeister, and Dr. Welton for serving on my graduate committee.

To my close friend and associate, Linds Long, for her support, encouragement, and for being a friend when I needed one.

To my dad, John Hall, and my family, for their support and wisdom, for which has encouraged me to reach for my greatest potential.

CHAPTER I
INTRODUCTION

Kansas is one of the nation's most prominent agricultural states. In 1985 Kansas was the nation's number one producer of wheat and sorghum grain as well as being first in flour milling capacity. The state ranked second in cattle slaughter and third in cattle production (Kansas State Board of Agriculture, 1985, page 2). In addition, Kansas is noted for being a top producer of other commodities. According to the State Department of Education, "Agriculture/Agribusiness in Kansas is basic to the economy of the state, generating billions of dollars and requiring the efforts of approximately one-third of the Kansas labor force. Of the total persons engaged in agriculture/agribusiness in Kansas, a majority are in production (farming and ranching) agriculture, while the balance are engaged in supplies, services, processing, and other supportive agriculture/agribusiness occupations". (Kansas State Department of Education, 1986). The United States Department of Commerce reported a state wide agricultural business payroll of \$37.4 million (U.S. Department of Commerce, 1985, page 1).

It is quite evident the agriculture/agribusiness industry is an important aspect in the Kansas economy. Because of its importance agriculture educators must provide

workers with the necessary skills and knowledge. To do so, educators must be able to identify competencies which are needed for people to work successfully in agriculture. It is also essential to determine what skills are critical needs and must be tended to first, which skills are commonly occurring needs and the needs of the agricultural work force in the future. By being able to identify and classify skills and competencies, agricultural educators can better develop instructional programs to meet the industry's need. Another benefit of classifying the needs as critical, common or future needs is that it can aid the educator in determining priorities.

In order to maintain quality programs, educators must be able to clearly determine the needs of the agricultural industry. To do so, educators should routinely conduct needs assessment surveys to determine needed skills and competencies.

In this study the investor decided to involve the agricultural organizations within the state of Kansas, as they represent the leaders of the agriculture industry. In addition agricultural organizations often sponsor non-traditional educational programs and develop instructional materials. In addition, it would appear that a more united effort between agricultural organizations and agricultural educators should provide substantial benefits for the Kansas agricultural industry.

Objectives

The primary objectives of this study were to:

1. Determine current and future educational needs of the agricultural industry.
2. Compile a list of active agricultural organizations in Kansas which conduct some form of education program.
3. Provide a stronger link between the Agricultural Education profession and the agricultural organizations in Kansas.

Significance of the Study

The significance of this study begins with identifying subject matter areas that need to be understood by agricultural workers. The nature of this study and its source should help make the findings of the study of interest to all agricultural educators in the state. High school vocational agriculture instructors should be able to use the information to develop their curriculum and enhance their program. In addition, this study may be utilized by postsecondary agricultural educators as they provide specialized instruction to prepare people for employment in the agriculture/agribusiness industry.

Definition of Terms

The following terms need clarification:

1. Critical Needs- Educational needs which are absolutely essential for people working in agriculture.
2. Commonly Occurring Needs- Educational needs which are frequently shared by people working in agriculture.
3. Future Needs- Educational needs that may become necessary for individuals to work effectively in agriculture in the near future. (1 to 5 years)
4. Participants- Contact person representing each agriculture organization which was involved in the study.
5. Vocational Agriculture/Agribusiness- The training of high school and/or postsecondary students through an instructional program to develop and/or supplement skills in agriculture/agribusiness occupations.
6. Human Relation Skills- Subject matter that is people oriented and involves a person's ability to work with other people.
7. Management of Resources- Subject matter relating to the management of a business. The

- ability to manage the financial inputs and outputs, as well as general management skills.
8. Knowledge and Practical Skills- Subject matter relating to a person having the capability of completing the tasks involved in the occupation area.
 9. Research- Responses from participants that indicated a need for additional research.

Limitations of the Study

The limitations of this study include:

1. Only open ended questions were ask. Respondents were able to identify any item they felt was an educational need for people working in agriculture.
2. Only 53 percent of those organizations which were randomly selected to participate in the study choose to do so.
3. Only one contact person from each organization was sent a questionnaire. It was suggested to this individual who was sent the questionnaire to respond according to his or her organizations perspective.

CHAPTER II
REVIEW OF LITERATURE

The literature which was review for this study covered needs assessments in agricultural education and vocational education. A review was conducted of needs assessment dealing with agricultural and vocational education in other states. An second area covered in the review was the justification and need to conduct needs assessments to determine competencies needed by people to work successfully in the agricultural industry.

Harland E. Priddle, past state secretary of agriculture, stated in the State Board of Agriculture Annual Report and Farm Facts, "Kansas is one of the nation's most prominent agricultural states" (Kansas Board of Agriculture, 1984, page 4). If one looks at the impact of the Kansas agricultural industry on the state's workforce you find "the agriculture/agribusiness industry requires the efforts of approximately one-third of the Kansas labor force (Kansas State Department of Education, 1986)". More specifically, Kansas agriculture is a multi-billion dollar industry. In 1985, the total value of field crops, livestock and poultry produced was over 5.16 billion dollars (Kansas Board of Agriculture, 1985, page 5). For the 1985 reporting period, a statewide agricultural business payroll of \$37.4 million and a statewide food and kindred products payroll of over

\$471 million was reported by the United States Department of Commerce (County Business Patterns, 1985, Kansas, U.S. Department of Commerce, page 1). These payroll figures do not include such agriculture industry areas as agricultural credit agencies, agriculture construction, and agriculture machinery, which the Department of Commerce figures into other major non-agricultural industry groups.

Agriculture and its related industries is the number one employer in the United States today, therefore the agriculture industry has a very large impact not only on Kansas, but has a large impact of the nation as well. John R. Block, former U.S. Secretary of Agriculture, states in Agriculture 2000 A Look at The Future , "as the nation's biggest industry, agriculture generates an estimated 23 million jobs, more than 22 percent of the entire work force in the United States".

According to Lee (1981) there are three jobs, in the off-farm sector of agriculture to every one job in farming or ranching. He indicated, that these individuals involved in off-farm jobs need competencies and training in agriculture. If workers in agribusiness jobs had this training then these agribusiness could operate more efficiently.

In a study conducted by the United States Department of Agriculture, (Graduates of Higher Education in the Food and Agricultural Sciences, July, 1980) investigators expected

the demand for college graduates in the food and agricultural sciences to exceed the available supply by 15 percent. In addition, they predicted a shortage of people with graduate degrees, indicating a need for highly trained individuals. The study also provided strong evidence that fewer college graduates in the food and agriculture sciences will have significant work experiences and background related to their degrees in the future.

In Agriculture 2000 A Look to the Future it stated, people with management training in one of four areas will be in demand by agribusiness to fill management positions. The four areas are Finance, Marketing, Personnel and Planning (page 79).

According to a report by the United States Department of Commerce (Farm Population of the United States, 1985, page 3), about 67 percent of the farm residents 15 years and over were in the labor force in 1985. This can be compare to a lower proportion of 64 percent of the non-farm population who are in the labor workforce. The report further indicated employed farm residents are equally divided between agricultural and non-agricultural jobs. The report went on to state that about 61 percent of the male farm residents are employ in agriculture occupations. While only 29 percent of female farm residents were employ in the agriculture industry in 1985. However, in the report, Agriculture 2000 A Look at the Future it indicated a trend towards increased

fense labor force participation in agriculture, in the future (page 91).

According to VanAusdle in an article in The Agricultural Education Magazine (April 1983), Walla Walla Community College in Washington, conducted an environmental needs assessment as part of a planning process for their agricultural department. VanAusdle indicated the needs assessment was the first step in a seven step planning process. The assessment was concerned with obtaining, analyzing and reporting information reflecting current and future needs of the agriculture department. The needs assessment according to VanAusdle should also determine the education and training needs of present and prospective students. Another major area of the study was the determination of present and future agriculture employment and career opportunities. This assessment, according to VanAusdle, provided the agriculture faculty with documented information. With this information the faculty could then examine the program's mission and goals, then make adjustments and revisions in order to meet student and employer needs.

"Education, no less than business, is trying to improve its productivity, quality of product, and innovative capacities", stated Long (1983). In addition, education must justify the need for financial support. According to Long, at Utah State University the need for agriculture education

has been examined through a needs assessment program initiated in 1977. Long indicated assessment is a state-wide employee and competency study. In Utah the studies of competency and employee needs are done on a four year cycle. The assessment according to Long, collects information on the employment needs in farming; ornamental horticulture; agricultural mechanization; and feed, seed and grain operations. In addition, the assessment also surveyed employer-employee relationships, such as incentive and fringe benefits policies. At Utah State University, the faculty use the needs assessment to maintain a quality program and meet productivity criteria, according to Long.

In another report, Legacy (July 1977), indicated one of the most important aspects of vocational education programs is the training provided which leads to job placement. If this is the case then it is necessary for those persons who are planning and conducting vocational programs to consider the employment needs of the industry.

In agriculture we have seen a change in the place of agriculture employment. According to a report by the Kansas State Board of Agriculture the number of farms in 1910 were 178,000. Since that time there has been a steady decline in the number of farms to a record low of 74,000 in 1984. While the number of jobs available in production agriculture have declined the number of employment opportunities in agribusiness has increased. The state of Kansas is the

leading state in flour milling capacity and second in cattle slaughtered and commercial grain storage capacity, all of which are agribusiness related industries (Kansas State Board of Agriculture, 1984, page 102).

If agribusiness supplies two-thirds of the jobs in the agriculture industry (Lee, 1981), then agriculture educators need to have a good definition of an agribusiness. Davis and Goldberg (1957) offers this definition "all businesses providing inputs of production, processing and distribution of agricultural products are defined as agribusinesses".

According to Legacy (1977), the increased technology of agribusiness has demanded a corresponding increase in the training level of agribusiness workers. In addition, the growing array of businesses and industries providing supplies, production, processing and distribution services to agricultural production has required an increasing number of trained workers.

In a study conducted by Legacy (1977) in Indiana, he found the new technology as has a major affect on agribusinesses in Indiana, much like what can be found in Kansas. He identified these trends: 1.) the number of people actively engaged in full-time farming has decreased, while the production of food and fiber has increased; 2.) there are a multitude of new and changing agricultural related occupations which require highly skilled persons in occupations directly related to production agriculture.

Because of the increased importance of agribusiness, there needs to be a determination of what the present and future employment needs in production and non-production agricultural business are.

In the need assessment study conducted by Legacy, the data related to a number of objectives was presented. He identify the types of businesses which employ workers who are required to have agricultural experience. He identify the number of employees needed to fill entry level positions in agriculture related business, who needed agricultural training and experience . Moreover he identify the number of employees needed to fill entry level positions because of expansion in agricultural related businesses. From this information Legacy was able to gather employment needs data from various agribusinesses.

According to Legacy, his study has accomplished a major step toward providing meaningful job demand data for vocational program planning in agriculture.

Summary

In summarizing the information obtained from the review of literature several statements can be made.

1. Since production agriculture and related businesses and industries supply more than 23 million jobs, creating more jobs than any other industry, it is evident, that many people need agriculture related skills and training.

2. With the number of farms decreasing, there are fewer opportunities for employment in production agriculture. However, with the rapidly advancing technology which has been occurring, there is a greater need for people with agricultural competencies in agricultural related businesses.
3. Employers are finding fewer people entering the job market who have significant work experience and background related to their degrees and entry level position in agriculture.
4. A needs assessment can provide valuable background information which will reflect current and future needs of workers. By conducting an needs assessment educators can more accurately develop a plan for providing a quality education.
5. In order for educators to provide quality education in agriculture at the secondary or postsecondary levels, they need to have access to current data on the competencies needed by people in order to be successfully employed in the industry.

The review of literature answered many questions concerning the conducting of a needs assessment, as well as the need for conducting such an assessment in agriculture. However, the review did raised questions concerning the current data available for educators in Kansas. Therefore, the researcher conducted this study to collect information on the current and future educational needs of people who are involved in the agriculture industry.

CHAPTER III.

METHODOLOGY

Population

The target population for this study was the agricultural organizations in Kansas as identified by the State Board of Agriculture, Kansas State University College of Agriculture and Kansas Foundation for Agriculture in the Classroom. A total of one hundred thirteen organizations have been identified by the three agencies. The investigator assigned each organization to a category to facilitate sampling. Table 1 presents a break down of organizations by category.

TABLE 1
Kansas Agricultural Organizations by Category
(N = 113)

Category	Number
Animal Science	56
Agronomy	20
Agricultural and Agribusiness	29
Special Interest and Horticulture	8

Sample

The study was designed to draw a 50 percent sample and thus provide each organization with an equal opportunity to participate in the study. Fifty percent of the organizations were randomly selected from each of the previously identified categories.

Instrumentation

The Education in Agriculture Needs Assessment Questionnaire was developed by the investigator following a review of related literature and research. The survey instrument was reviewed by the Agricultural Educational Faculty at Kansas State University and several graduate students in Agricultural Education. The questionnaire was field tested by sending the questionnaire to contact persons from organizations that were not randomly selected to participate in the study. The contact persons who were involved in the field test were located on the campus of Kansas State University. Final modifications to the instrument were made following the completion of the field test.

Data Collection

Survey instruments were mailed to contact persons of randomly selected agricultural organizations. Two weeks after the initial mailing, follow-up questionnaires were sent to all non-respondents. An additional 10 days were scheduled for the return of follow-up questionnaires. Following the mail follow-up of non-respondents, approximately a 10 percent random sample of remaining non-respondents were contacted by phone to determine if significant differences exist between respondents and the non-responding group. All responses were treated as group data with questionnaires numbered for grouping into categories and identification of non-respondents.

Data Analysis

The investigator analyzed the data with some assistance as needed from other graduate students in Agricultural Education. All responses were categorized by the investigator, and then frequency counts and percentages were tallied by hand. They were then recorded by the investigator.

CHAPTER IV
ANALYSIS AND INTERPRETATION OF DATA

In this chapter, the results of the survey, will be disclosed. The survey was completed by twenty-nine agricultural organizations in Kansas. Information was gathered concerning industry affiliation, at what level the organization serves its members, type of organization, whether or not the organization has an educational program, audience served by their educational program and time devoted towards educational programs. In addition open ended questions were asked to gathered information on the critical needs, commonly occurring, and the future needs of people working in agriculture in eight occupational employment areas of agriculture.

PROFILE OF PARTICIPANTS

Agricultural Organization Affiliation

As indicated in Table 2, the organizations were divided into four areas for this study. The largest group represented with forty-five percent of the study population was the animal science organizations. The second largest affiliation was the groups categorize as agricultural support and agri-business with thirty-five percent of the return. These organization affiliations are with general

agriculture production. The agronomy related organizations represented ten percent of the organizations responding to this study. The final group was the special interests/horticulture organizations which represented the final ten percent of the study.

TABLE 2
 AGRICULTURAL ORGANIZATION AFFILIATION
 (N = 29)

Industry Affiliation	Number	Response Rate	% of Respondents
Animal Science	13	46	45
Agronomy	3	30	10
Agricultural Support and Agribusiness	10	67	35
Special Interest	3	75	10
Total	29		100

Level of Organization

Table 3 reveals the level at which the organizations serves its members. As one might expect in a study involving organizations representing the agriculture industry in the state of Kansas, 65 percent of the organizations serve their members at the state level. Further analysis shows that 20 percent of the organizations serve their members at the national level. Seven percent of the organizations in the sample where local representative organizations and 3.5 percent serve its members at either the regional and area levels.

TABLE 3
 LEVEL AT WHICH THE ORGANIZATION SERVE ITS MEMBERS

Level	Number	Percentage
International	0	0
National	6	21
Regional	1	3.5
State	19	65
Area	1	3.5
County	0	0
Local	2	7

Type of Organization

In Table 4 the data show 69 percent of the organizations have an educational interest. This is an indication that the organization has a strong concern for education in some form. The form may be the education of the public, group members, or youth programs. Thirty-five percent of the organizations are commodity oriented, in which the members of the organization are involved or interested in production agriculture. Thirty-one percent of the organizations have a special interest which brings

members together. Fourteen percent of the organizations were socially oriented groups.

Educational Program Provided By Organization

Seventy-six percent of the organizations survey indicated they provided an educational program or supported an educational program. In Table 5, the data show 41 percent of the organizations provided the educational programs for

the general public. This is an indication that these organizations are concerned with providing education assistance. Thirty-eight percent of the organizations provided educational programs or materials for adults and 35 percent provided programs for youth.

Educational Needs of People in Animal Science

In Table 7 information can be found on the educational needs of people working in animal science related occupations. Since each question in the survey was optional only 15 of the 29 participants responded to this question. The various answers are in rank order according to the frequency of occurrence and are broken down into critical needs, commonly occurring needs, and future needs (see Appendix D for reporting format). It is easy to notice that some answers appear in each classification. This is interesting and noteworthy because these organizations feel these items are crucial to have in an educational program which is preparing people for employment in the animal science industry. A review of the data indicates that marketing and economic management, nutrition and animal health tended to be the areas of greatest need.

In table 8 the researcher has classified the topics in table 7 into four categories by type. The four categories and a definition for the categories are: Human Relations Skills, subject matter that is people oriented and involved a person's ability to work with other people; Management of Resources, subject matter relating to the management of a business, the ability to manage financial inputs and outputs, as well as general management skills; Knowledge and Practical Skills, subject matter relating to a person having the capability of completing the tasks involved in the

occupational area; and Research, responses from participants that indicated a need for additional research.

As might be expected, respondents indicated a strong need for knowledge and practical skill instruction, as well as management instruction.

Educational Needs of People Working in Agronomy

In Table 9 the researcher summarized the educational needs of people working in Agronomy. The various answers which were given are rank in order and are grouped into critical needs, commonly occurring needs and future needs. It is interesting to note that the understanding of economic concepts and marketing was the most frequent response given as a critical need of people who are involved in occupations concerning agronomy.

In Table 10 the researcher divided the responses in Table 9 into four categories by type, as explained previously. The four categories are Human Relations Skills, Management of Resources, Knowledge and Practical Skills, and

Research. Consistent with findings in animal science, knowledge and practical skill areas, followed by management of resources were of the greatest need.

Educational Needs of People Working In Agriculture Mechanics
 and Agriculture Construction

In Table 11 the researcher has summarized information which the organizations have identified as educational needs for people who have occupations in agricultural mechanics and agriculture construction. There were a total of 11 organizations which responded to this question. As in Table 7 and Table 9 the responses are divided into critical needs, commonly occurring needs, and future needs. The respondents indicated repair and maintenance of equipment and buildings,

followed by safety and health as being the most needed education activities.

In Table 12 the researcher classified the items identify in Table 11 into the four type divisions. As with the previous agricultural area, knowledge and practical skill instruction followed by instruction in management of resources were the most frequently reported as needs.

Educational Needs of People In Agricultural Finance and Resource Management

The participants provided information concerning education needs of people who have occupations in agricultural related financial and resource management in Table 13. A total of 11 organizations responded to this question. As one might expect, they identified topics concerning economic concepts, marketing, management, accounting and other business related topics as critical and commonly occurring needs of people working in this area.

In Table 14 the researcher divided the information provided in Table 13 into the four type divisions. In contrast to previous findings participants identified management oriented instruction as the major need of people employed in agricultural finance and resource management.

Educational Needs of People In Conservation of Natural Resources Occupations

In Table 15 the researcher has listed the information which participating organizations provided concerning the educational needs of people working in conservation of natural resources. Only six organizations choose to participate in this question. The responses are again divided into three sections, critical needs, commonly occurring needs, and future needs. It is interesting to note that most organizations identify soil and water conservation as a critical need for which education should be provided.

In Table 16 the information from Table 15 has been categorized by type. Similar to the findings for the first three occupational areas, major educational needs were identified for knowledge and practical skill instruction followed by management instruction.

Table 15

Educational Needs of People In Agricultural Processing Occupations

The data in Table 17 provide information concerning the educational needs of people who are employed in agricultural processing occupations. Participants in this area identified needs in processing processes as the major need.

In Table 18 the researcher has classify the responses found in Table 17 into types of instruction. Again knowledge and practical skill instruction followed by management instruction were identified as areas where instruction is needed.

Educational Needs of People in Agricultural Sales/Service Occupations

In Table 19 the researcher has summarized information concerning the educational needs of people who have occupations in agricultural sales/services. The information has been categorized as either critical needs, and commonly occurring needs. No needs were identify as future needs by the organizations which responded to the question. A review of the data reveal marketing, communications, and business practices as the major educational needs.

In Table 20 The researcher has classified the topics in Table 19 into four categories by type. Consistent with the

findings in agricultural finance and resource management, management of resources was the major type of instruction needed.

CHAPTER V
SUMMARY AND RECOMMENDATIONS

The purpose of this chapter is to present a review of the study. A review of the purpose, objectives and procedures of the study are included. Also included in this chapter are the investigator's recommendations based on the major findings.

Summary of the Study

Purpose

The primary purpose of this study was to conduct an needs assessment of the educational needs of people who work in agriculture or agricultural related industries in Kansas.

Objectives

Three specific objectives were identified as guides in the development and evaluation of this study:

1. Determine current and future educational needs of the agriculture industry.
2. Compile a list of active agricultural organizations in Kansas which conduct some form of education program.

3. Provide a stronger link between the Agricultural Education profession and the agricultural organizations in Kansas.

Methodology

This study was conducted to make an assessment of the educational needs of people who are currently working, or planning to work in the agricultural industry in Kansas. The study was designed to obtain information concerning educational need from agricultural organizations in the state. One hundred thirteen agriculture organizations were identified in Kansas. A random sample of 56 (50 percent) agriculture organizations were sent questionnaires. Twenty-nine (52 percent) of the sample returned the questionnaire.

The survey instrument contained checklist type questions to obtain general background information on the organizations. In addition, open-ended questions were used to gather information on seven occupational areas: animal science, agronomy, agricultural mechanics and agriculture construction, agricultural finance and resource management, conservation of natural resources, agricultural processing, and agricultural sales/service. Respondents were asked to identify areas or topics in which agricultural workers need to receive additional education. In addition, they were to

specify if such needs were critical needs (educational needs which are absolutely essential for people working in agriculture), commonly occurring needs (educational needs which are frequently shared by people working in agriculture), future needs (educational needs that may become necessary for individuals to work effectively in agriculture in the near future).

Major Findings

The following items are the major findings of this study:

Description of Sample

1. The majority (65 percent) of the agricultural organizations in the study, are state level organizations.
2. Twenty-one percent of the agricultural organizations in the study served its members at the national level.
3. Thirty-five percent of the organizations sampled, were commodity oriented.
4. Sixty-nine percent of the organizations in the survey indicated they had an educational interest.
5. Seventy-six percent of the organizations in the study indicated they either provided an

educational program or supported an educational program.

6. The majority of the organizations provided educational programs for more than one type of audience. The educational programs which were provided by the organizations were directed towards the following audiences:

General public	- Forty-one percent
Adults	- Thirty-eight percent
Youth	- Thirty-five percent
Group Members Only	- Thirty-one percent
Other	- Three percent

7. The majority of the organizations surveyed (88 percent) spent less than forty percent of their time, devoted towards educational programs. Twelve organizations (48 percent) indicated they spent less than ten percent of their time, devoted towards educational programs.

Analysis of the Educational Needs Data

1. The respondents' perspective of the educational needs of people working in animal science related occupations indicated that knowledge and practical skills instruction is very important. The responses also indicated that marketing, economics and animal nutrition were the most frequently mentioned critical needs. Nutrition, animal health and promotion were the most frequently mentioned commonly occurring needs. While management skills and marketing were the most frequently identified future needs.
2. The respondents' perspective of the educational needs of people working in agronomy related occupations indicated that knowledge and practical skills instruction is needed. Economics, marketing, computer knowledge, soils, chemistry and plant diseases were the most frequently identified as critical needs. Soils and crops were the most frequently identified commonly occurring needs. The responses indicated marketing was a future need.
3. The respondents' perspective of the educational needs of people working in agricultural mechanics and agricultural constructions related

occupations, indicated that knowledge and practical skills is very important. Repair and maintenance was the most frequently identified as a commonly occurring need for education.

4. The respondents' perspective of the educational needs of people working in agricultural finance and resource management related occupations, indicated that instruction in the management of resources is greatly needed. The most frequent responses as a critical need were economics, marketing, management, and accounting. While management was the most frequent identified commonly occurring need.
5. The respondents' perspective of the educational needs of people working in conservation on natural resources related occupations, indicated that instruction is needed in knowledge and practical skills. The most frequently identified as critical needs was soil erosion and water conservation.
6. The respondents' perspective of the educational needs of people in agricultural processing related occupations indicated that instruction is needed in both management of resources, and in knowledge and practical skills. Health and marketing were

the most frequently listed response as a critical need.

7. The respondents' perspective of the educational needs of people on agricultural sales/service indicated that instruction is needed in the management of resources. The most frequent response as a critical need was marketing. While communications was the most frequent response as a commonly occurring need.

Recommendations

1. Agricultural educators at all levels should utilize materials and programs provided by agricultural organizations to aid and enhance instruction whenever appropriate.
2. Whenever possible, agricultural educators should provide assistance to agriculture organizations which provide educational programs or develop instructional materials.
3. Agricultural organizations should be encouraged to continue providing educational programs and materials.
4. Opportunities to gain practical hands-on experience must be continued at the secondary level.

5. Educators at the post-secondary levels should encourage students to gain on the job experience in their field of interests.
6. Students who are interested in entering occupations in animal science or agriculture sales/service, need to be encouraged to actively participate in extra-curricular activities and organizations. Students need to be involved in activities which will provided experience in communications, working with people and promotion activities.
7. People who what to be employed in the agricultural industry need more education in agricultural economics. People who work in all areas of agriculture need more knowledge in marketing, finance, management, economics concepts, and cost effective production.
8. People who plan to enter an occupation in the animal science industry need education in marketing, economics, management and in a wide range of specific areas in animal science like: genetics, nutrition, breed identification, veterinary/health, and carcass knowledge.
9. People who plan to enter occupations in the animal science industry need to understand promotion,

advertising and the needs and concerns of the consumer.

10. People who enter occupations in the agronomy industry need education in economics, marketing, computers, management, and in specific agronomy areas like: soils, crops, chemistry, plant diseases, and entomology.
11. People who enter occupations in the agricultural mechanics and agricultural construction industry need education in general repair and maintenance, equipment repair, building repair, safety, and exposure to high tech equipment.
12. People who enter occupations in relating to agricultural finance and resource management need education in economics, marketing, management, accounting, and computers.
13. People who enter occupations in conservation of natural resources related occupations need education in water and soil conservation.
14. People who enter occupations in agricultural processing need education in marketing food science, health, processing, storage management and other related areas.
15. People who enter into occupations in agricultural sales/service need education in marketing, communication, management, and commodity knowledge.

16. A list of educational programs and instructional materials which are develop or conducted by agricultural organizations in Kansas should be compile on a yearly basis. This information should be made available to vocational agriculture teachers, educators at technical schools, community colleges, extension educators and other interested parties.

Recommendations for Further Studies

A study should be conducted in the future based on the data collected in this study. A survey questionnaire can be develop for each occupation area using a multiple answer question and a Likert scale. The questions should be formulated based on the data received from this study on the educational needs of people working in each of the occupation area identify in this study.

In addition, another study can be conducted to determined to what extent are the educational programs and instructional materials, which are develop by agricultural organizations used by agricultural educators in classroom instruction.

Dear

In order to maintain a quality educational program in agriculture it is essential to identify the educational needs of people working in agriculture. As part of my master's study I will be determining these educational needs as viewed by agricultural agencies and organizations in Kansas.

I am asking for your assistance in identifying agricultural organizations and agencies. I need to compile a list of such groups that would have an understanding of the needs of agriculture. Any assistance you are able to provide in identifying these agricultural agencies and organizations in Kansas will be greatly appreciated. Enclosed is a self addressed, stamped envelope to facilitate the return process. I would like to have this list return by January 9, 1987.

I feel in contacting these agencies and organizations I can conduct a study which will provide agriculture educators a better understanding of the educational needs of agriculture. The information gather will be of interest to agricultural educators at the secondary, postsecondary and university level. In addition, the cooperative extension service may be able to utilize this such needed information.

Your cooperation to help make this study a success is genuinely appreciated.

Sincerely,

James E. Hall
Master Of Science student in Agricultural Education

Dear,

In order to maintain a quality educational program in agriculture it is essential to identify the needs of people working in the agriculture industry. As part of a study being conducted by the Agricultural Education faculty at Kansas State University I will be determining these educational needs as viewed by agricultural organizations in Kansas.

As part of the study your organization has been randomly selected to be surveyed. Enclosed is an Agricultural Education Needs Assessment questionnaire which I would like you to fill out and return. As the contact person for your organization I feel you can answer these questions as viewed from your organization's perspective. Also enclosed is a self addressed, stamp envelope to facilitate the return process. I would like to have this questionnaire return by March 26, 1987.

The information received will be held in strict confidence and disclosed in group information only. If you have any questions or concerns feel free to contact me at the above address or call (913) 532-5904.

Your assistance will be greatly appreciated by the Agricultural Education faculty at Kansas State University, as we look for ways to enhance Agricultural Education programs.

Sincerely,

James E. Hall
Project Coordinator

Section II.

Directions: The next four pages contains two sections, Occupations in Production Agriculture and Occupations in Agri-Business. Each section contains statements concerning specific occupations areas. Please read each of those statements and identify necessary educational requirements for people working in those occupational areas. Please identify topics which, from your organization perspective, are needed for people entering into a agriculture field. Classify those needs as one of the following:

Critical Needs- Educational needs which are absolutely essential for people working in agriculture.

Commonly Occurring Needs- Educational needs which are frequently shared by people working in agriculture.

Future Needs- Educational needs that may become necessary for individuals to work effectively in agriculture in the near future. (1 to 5 years)

If you feel you are unable to identify and classify the educational needs of people for the occupational area for a question please write in "NA" for the question.

Dear:

I need your participation and assistance! Recently you received a Agricultural Education Needs Assessment Questionnaire from me. At this mailing, I have not received your survey. If it has been returned, I thank-you. If not, will you take a few minutes and complete the enclosed survey and return it to me TODAY!!

This survey is part of a study being conducted to determine the educational needs of people working in the agricultural industry. The information gather in this study will be made available to the Kansas Vocational Agriculture Teachers Association(KVATA), Cooperative Extension Service, Agriculture Educators at Kansas State University and other agricultural education groups in the state of Kansas.

As the contact person for your organization, I feel you can identify skills and competencies needed by people who are preparing themselves for a career in the agricultural industry. By identifying the skills and competencies needed to work in the various occupational areas, agricultural educators at all levels can better prepared people to be involved in agriculture as a career.

The information received will be held in strict confidence and disclosed in group information only. If you have any questions concerning the questionnaire or the study itself, please feel free to contact me at the above address or call me at (913) 532-5904.

Thanks again,

James E. Hall
Agricultural Education
Graduate Teaching Assistant

Re: Review Enclosed Survey

The following is a survey questioner which will be sent to random selected agricultural organizations in Kansas. The questioner will be sent to the contact person of the selected organization.(executive officer, secretary or president) The organizations which make up the population were identify by the following:

Dr. Walter Woods, Dean of Agriculture
Sam Brownback, State Secretary of Agriculture
Fran Parmley, Administrator, Kansas Foundation for
Agriculture in the Classroom

The purpose of this study is to determined the educational needs of people working in Agriculture, as viewed by agricultural organizations in Kansas.

Please review this survey and write any comments or suggestions you made have down on this survey. I would like to have this survey return to me with your suggestions by February 3, 1937.

Thanks for your time in making this a quality study.

AN ASSESSMENT OF THE EDUCATIONAL NEEDS OF PEOPLE WHO WORK
IN AGRICULTURE OR AGRICULTURE RELATED INDUSTRIES

by

JAMES EUGENE HALL

BS., Kansas State University, 1985

AN ABSTRACT OF A MASTER'S REPORT

submitted in partial fulfillment of the

requirements for the degree

MASTER OF SCIENCE

AGRICULTURAL EDUCATION

KANSAS STATE UNIVERSITY
Manhattan, Kansas

1987

Agriculture/Agribusiness in Kansas is basic to the economy of the state, generating billions of dollars and requiring the efforts of approximately one-third of the Kansas labor force. Because of the importance of the agriculture industry, agricultural educators must provide workers with the necessary skills and knowledge. The purpose of this study was to conduct a needs assessment of the educational needs of people who work in agriculture or agriculture related industries.

A survey instrument was sent to the contact person for 56 randomly selected agriculture organizations in Kansas. Twenty-nine (52 percent) choose to participate in the study. Open ended questions were asked to obtain the critical needs, commonly occurring needs and future needs of people who work in eight occupation areas of agriculture.

People who work in the agricultural industry need more knowledge in agricultural economics. People in every occupation area of agriculture need more educational preparation in marketing, finance, management, economic concepts and cost effective production.

The study indicated people need more practical hands-on experience in agricultural production. People who are employed in agribusiness need to be more aware of production costs, farm management and have more commodity knowledge.

More training and preparation is needed for people in the latest technology available in agriculture.

Those people who work in animal production need practical experience and knowledge of all aspects of the livestock industry. In addition, they need to be aware of the needs and wants of the consumer. Those who are employed in crop production also need practical experience and knowledge in all aspects of agronomy.

Those people who are employed in agricultural mechanics and agricultural construction need to be prepared to handle a broad area of repairs and construction.

For those people who enter occupations involving conservation of natural resources, they need education relating to water and soil conservation.

For those people who plan to enter into occupations in agricultural processing, they need education in food science, health, processing and storage management.

For those people who are entering occupations relating to agricultural finance, they need education in areas of finance, farm management, marketing, production costs and human relation skills.
