1995 KANSAS PERFORMANCE TESTS WITH SPRING OAT VARIETIES

INTRODUCTION

The number of acres utilized for spring oats production is small in comparison to the acreage used for the major crops in Kansas. However, this does not limit the potential importance of spring oats on individual producer's farms. Spring oats often are used in crop rotations or when winter wheat acreage is restricted or winter-damaged. Either grain or forage production from spring oats can make a significant contribution to a crop or livestock enterprise.

Spring oat production figures for 1995 and preceding years are given in Table 1. Oat production for 1995 at 3.8 million bushels was substantially lower than the 5.5 million bushels produced in 1994. The lower production was a combined result of lower acreage and slightly lower yields. In 1995, only 65% of the planted acres were harvested.

Table 1. Acreage, yield, and total production of spring oats in Kansas, 1975-1995 (Crops Report; Kansas Agricultural Statistics, August 11, 1995).

Year	Total Acres (1,000's)		Yield bu/acre	Total Production 1,000 bu
	Sown	Harvested		
1995	130	85	45	3,825
1994	160	120	46	5,520
1993	70	30	34	1,020
1992	200	140	56	7,840
1991	160	110	53	5,830
1990	160	120	55	6,600
1975-89	213	153	46	7,040
1975-95	194	138	47	6,487

1995 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station conducts trials of various crops at several locations throughout the state to provide agronomic information on new and established varieties and hybrids under current growing conditions. Table 2 lists the oat varieties included in 1995 Kansas tests. Because very few oat varieties are developed by private companies, most of

the varieties in the tests have been developed and released by public universities or agricultural experiment stations.

Table 2. Spring oat varieties grown in 1995 Kansas performance tests.

Hazel	IL	1985	Starter	MN	1986
Horicon	WI	1990			

* Certified seed produced in Kansas in 1995.

Spring oat tests have been conducted at various locations for several years. Locations of 1995 spring oat test sites are shown on the map on the front cover. Site descriptions, management practices, and growing conditions are summarized in Table 3. The location codes listed in parentheses after each location name are used as column headers in the data tables.

Performance of specific varieties in 1995 can best be determined by examining Tables 4 through 8. The information in these tables is derived from replicated varietal comparisons at the sites listed in Table 3. Yields are reported in Table 4 as bushels per acre (32 pounds per bushel) adjusted to a moisture content of 12.5 % and as percentages of the test averages to speed recognition of highest yielding entries (more than 100%, the test average).

Table 6 provides yield performance of most entries over several years at the different testing locations. Measurements of characteristics often contributing to yield performance are shown in Table 5 (test weights and harvest moisture), Table 7 (maturity differences), and Table 8 (lodging and shattering for locations where varietal differences in these characters were noted).

Table 3. Oat Performance Test site descriptions, management, and conditions in 1995.

County and cooperators	Site, nearest town, and location code	Dates of planting & harvest	Soil type and previous crop	Fertilizers applied, lbs/a			Seeding rate and row spacing

1994 - 1995 SUMMARIES

Tables 9-12 present performance information averaged over the past two growing seasons. This type of analysis was possible because the same entries were in all tests over the 2 years. For these summaries, the tests were grouped into regions: Northeast = Brown and Riley Co. tests; Southeast = Franklin and Labette Co. tests; Central = Harvey and Reno Co. tests; and West = Thomas, Greeley, and Finney Co. tests. The "State" column presents averages over all tests for the past 2 years. In addition to the summary statistics described below, each column in these tables also includes the number of experiments that contributed to the averages presented in that column.

At the bottom of each column of replicated data in the various tables is the L.S.D. (Least Significant

Difference). Unless two varieties differ by more than the L.S.D. given, little confidence can be placed in one being superior to the other. The use of the L.S.D. is intended to reduce the chance of overemphasizing small differences in yield or other characteristics. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of the same variety grown only a short distance apart.

Another statistical parameter is the coefficient of variation (C.V.) shown at the bottom of most columns. This figure, if properly interpreted, can be used to estimate the degree of confidence one may have in the data presented. In this testing program, C.V.'s below 10% generally indicate reliable, uniform data, whereas C.V.'s from 11 to 15% usually indicate less desirable but generally useful data for the rough performance comparisons desired from these tests.

* Barley Yellow Dwarf, rated at late flower - early boot; 1 = no disease symptoms, 9 = severe stunting and yellowing.

** Unless two varieties differ by more than the L.S.D., little confidence can be placed in one being superior.

Table 9. Yield from 1994 and 1995 Kansas Spring Oat Performance Tests.

Cultivar	Region					Region				
	N-east	S-east	Central	West	State	N-east	S-east	Central	West	State

Table 12. Lodging and shattering from 1994 and 1995 Kansas Spring Oat Tests.*

Cultivar	Region					Region		
	N-east	S-east	Central	West	State	Central	West	State
	lodging, %					shattering, %		
Armor	3	41	5	3	10	0	3	1
Bates	18	45	17	17	22	2	3	2
Brawn	5	36	0	2	8	1	2	1
Dane	6	22	4	7	8	1	2	1
Don	19	46	7	33	24	2	3	2
Hazel	10	36	4	3	11	1	2	1
Horicon	3	23	4	2	6	0	2	1
Larry	11	50	4	15	16	1	2	1
Ogle	2	35	1	1	7	0	2	1
Prairie	5	45	5	3	11	0	2	1
Premier	7	39	8	7	12	0	3	1
Settler	32	44	5	13	21	1	2	1
Starter	17	45	4	11	16	1	3	2
No. Tests	3	2	3	3	11	2	2	4
Test Average	10	39	5	9	13	1	2	1
C.V. (%)	78	26	158	112	69	81	34	57
L.S.D.(0.05)**	6	9	5	7	3	1	NS	0

* Only tests with significant levels of lodging or shattering were included in the analysis.

** Unless two varieties differ by more than the L.S.D., little confidence can be placed in one being superior.

Excerpts from the UNIVERSITY RESEARCH POLICY AGREEMENT WITH COOPERATING
SEED COMPANIES*

Permission is hereby given to Kansas State University to test our varieties and/or hybrids designated on the attached entry forms in the manner indicated on the test announcement. I understand that all results from Kansas crop performance tests belong to the University and to the public and shall be controlled by the University so as to produce the greatest benefit to the public. It is further agreed that the name of the University shall not be used by the company in any commercial advertising either in regard to this agreement or any other related matter.

* This agreement must be signed by an authorized individual before results involving the company's entries can be published by the Experiment Station. Except for the limitation that the name "KANSAS STATE UNIVERSITY" cannot be used in advertising (you may use something like "official state tests" or "state yield trials"), this does not preclude the use of data for advertising, if done in a fair manner.
